The cat's whisker forms one terminal of the diode in all of these cases, and the tin cup, crystal holder, or the screws holding the razor blade to the board, serve as the other terminal of the diode. The mechanisms to precisely position and hold the cat's whisker for these detectors were often marvels of mechanical precision, but you can use a spring clothespin as a cat's whisker holder for your homemade radios.

You need high impedance headphones with any crystal radio. The only way the signal can break over the potential barrier of the detector used is for its voltage to have built up in a high Q resonant circuit. Loading this circuit with low impedance headphones would lower the Q so much that the barrier potential wouldn't be exceeded. Amateurs typically used headphones of 2,000 ohms impedance, but the high rollers would spring for more expensive headphones of 20,000 ohms impedance. A few headphones made from piezoelectric materials, the so-called crystal headphones, could have an impedance as high as 100,000 ohms. Sound quality from these was typically much poorer, however. (The higher the impedance, the more sensitive the radio will be.)

The earliest crystal radios didn't use an explicit lumped LC tank. The antenna was designed to be *self-resonant* at the desired frequency. This required it to be cut to a precise length. A loading coil, with a sliding tap, was used to electrically shorten the required antenna to less than a 1/4-wave, and to allow it to be tuned over a limited range. It was worked against Earth, or against a counterpoise. Later, a capacitor was added in parallel with the coil to form a parallel LC tank resonated to the desired frequency. When this was done, the precise physical length of the antenna became much less critical, one could even use a horizontal dipole fed with ladder line and link coupled to the LC tank, and selectivity was better (though still very poor).

To further increase selectivity, a loose coupler was used. This was made with a LC tank connected to the antenna, and another LC tank connected to the diode detector. The mutual coupling between the two coils was adjusted by varying the spacing of the two coils from one another. The looser the coupling, the better the selectivity, but also the worse the sensitivity. One couldn't have both sensitivity and selectivity at the same time until active amplifiers were invented. Early active radios might have as many as 3 stages of loose coupling to achieve the desired amount of selectivity. These sets were called TRF radios. Vacuum tube diode detectors replaced the crystal detector in these sets.

This is probably more than you wanted to know about early receivers.

>
I remember seeing (and listening to) one of these built as a high school science project. As well as I can remember, the razor blade had the brand name etched into it. By placing a sewing needle lightly against the brand name, a crude semi-conductor is formed that can be used as a detector. The radio that I listened to had this type of detector, but had commercial headphones. My question is how did they build an earphone out of "found objects".

Ideas?

>blessing for transverters, however.

The output at the transverter jack is much lower than 10 mW. 10 mW is
what most available transverters want to see, but the 735 puts out less
than a milliwatt. The reason for this is that the transverter output is
tapped off the pre-pre-driver stage instead of the pre-driver stage so
the transverter port can be used transceive.

As long as you're going to use the separate Rx input anyway, you can fix
that. The cable going from the pre-driver on the main board to the driver
on the PA board is the right level to drive most transverters. Just unplug
this cable from the main board, and plug the transverter jack cable in its
place. Now you'll have about 10 mW at the transverter jack on the back, but
you can't *transceive* on this port anymore. (That's Ok, you're using the
separate Rx port to receive.)

If you add another jack to the back, you can route the cable going to
the PA to it. Then to restore the radio to normal operation, all you
need to do is put a jumper on the outside on the back between this new
jack and the transverter out jack. Simple. This way you can never over-
drive a transverter, and you'll have the right level for most modern
transceiver designs.

I don't know what Icom was thinking when they set the radio up this way.
Perhaps they had plans, which never materialized, to offer transverters
for it which required the lower drive level. Anyway, after this mod,
it is a wonderful radio to use with transverters.

1638. Equipment designation on old QSL cards --

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-10 00:00:00 UTC
From: jwg6@cornell.edu
Message-ID: <jwg6-1002971419010001@cu-dialup-0823.cit.cornell.edu>
Source record: 97529

I have several stacks of qsl cards dating back to the late 30s, up through the 70's, which were the collection of W3GCN, my wife's grandfather.

They are fun to look through , and I find the personal and station notes to be quite interesting.

Question is this:

On many of the oldest cards, transmitters and receivers were listed separately (no compact transceivers back then!). BUT they don't give the tube names. All they will have is a set of numbers, separated by hyphens, denoting the circuits used.

What do these numbers stand for? Are they prefixes to the tube types or something? How can you tell what the circuit was like just by these sets of numbers?

Thanks, 73

Joel N1AEP

1639. WTB: 10mtr CW transmitter strip/Exciter Module

Newsgroup: rec.radio.amateur.homebrew

From: doug469@knox.mindspring.com
Message-ID: <5dnsu2$irb@camel5.mindspring.com>
Source record: 97530

Hi All,
I need a small 10mtr crystal controlled CW transmitter strip for a beacon project. Preferably 5w out or less (1 - 2 watts would be perfect), 12vdc powered. Looking for something similar to the ones advertised in the ham mags for 20,30,40 and 80mtrs. Transmit only.

I would prefer a pre-built unit, (I don't have a lot of time for kit building these days) but a kit would be fine.

Anybody out there have such a beast or know were I can find one????

Thanks >>> Doug

[...]

The original article is Feb '91, pp 3-9, and the corrigendum appeared in the Aug '91, pp 21-2. A complete, modified schematic appears in the corrigendum, (p.22) but even it has one obvious typo: At the top right of the circuit (which is on the top left of the page) there is a wire that directly shorts out a protection diode, making the diode superfluous. Probably, the wire is the typo as the diode was one of the things added in the "corrected" circiut. This offending wire is immediately to the left of the diode's part number, "UES 1306."

I am not aware of any other published corrections to this circuit.

As I wrote before, I have not built the full, high-power version of the circuit, only low-power mockups of it. Also, I repeat that I *did* build the TTL "square wave" oscillator, but found it didn't give anything like a square wave output. And has anyone managed to find the input-mains DC filter cap in the picture? It's 5100 uF at 400 V - and there's no hint of in on the photo on p. 5 of the article.

I apologize for my delay in locating the reference.

I have a 28 MHz MOSFET transmitter running abt 6 Watts out(Uses IRF510). The oscillator is a 14 MHz VXO driving a buffer to a balanced diode doubler. These give very clean output,easily filtered to yield 28 MHz drive. All spurious & sub-harmonics are down -55 dBc with a single-tuned tank after the diode doubler. I've done this for all the HF bands 80-10 with repeatable results, but I did see a recent QST article (Jan 97??) using exclusive-OR gates with RC time delays to produce doublers. You could do some experiments with these and it would be interesting to see if the output is clean or not. Best of Luck!! de Mike WN2A

>100 watt stations have a battle, and many turn off.

Peter, I'd suggest you don't have a good feel for the normal QRM
levels in the US on 75m. On most nights, you can tune across the
entire 75m band without seeing the S meter drop below S9 (mostly
these are stations from 4 and 5 land as heard from my location, kW
amps appear the rule, and low antennas appear to be the rule, so
a lot of this is high angle stuff which you'd never hear in your
location, but which simply swamps us here). I'm afraid that 5 watts
doesn't have much of a chance against that.

I *have* used 5 watts successfully (TenTec Argonaut) *very* late
at night after most operators have gone to bed. But during the
prime evening hours, you have to have enough power to make it
through all the QRM. 100 watts suffices most of the time to make
a contact anywhere in North America. During summer, when heavy

static adds on top of the QRM, a kilowatt sometimes isn't enough (mainly because everyone else has fired up *their* kilowatts too).

As the CBers are fond of saying (and unfortunately our 75m band often sounds like CB), the signals are "wall to wall and treetop tall" on 75m here in the US during prime evening hours. You just cannot find a completely clear spot to operate. During less busy times, low power can work. Of course you can move down to 80m and use a non-voice mode at low power even in prime time bacause there is far less activity there and you can almost always find a clear frequency. I've done Clover at ridiculously low power levels around 3625 kHz even during prime time (I've had successful contacts out to 1000 km at the 20 mW level).

I figure that for good SSB voice contacts, I need 100 watts on 160m (maybe more depending on how efficient an antenna I can get up on 160m at the time), 75m (amateur QRM limited), and 40m (foreign broadcast QRM limited) during prime time. On the bands above 40m, 10 watts is usually plenty unless you're trying to bust a Dx pileup, which I don't do. I have a kilowatt amp, but rarely use it, typically only for a net check in with traffic on 75m in summer during prime time. Since I handle most traffic on digital modes, where low power is plenty, the amp is rarely used.

Now make no mistake, if you're willing to hunt and pounce and keep contacts very short, you can probably make contacts on 75m SSB with 5 watts even in prime time. But you won't make many, and you won't do much extended ragchewing, unless you have the capability to turn up the wick a bit.

1645. How to couple transmitter to antenna?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-10 00:00:00 UTC
From: jwg6@cornell.edu
Message-ID: <jwg6-1002971413160001@cu-dialup-0823.cit.cornell.edu>
Source record: 97536

Hi. I have an old Thordesen (sp?) transformer catalog, looking to be from late 50's/early 60's. It includes several transmitter/exciter and modulator circuits, with instructions for building them.

The info is very interesting and nostalgic. However, I noted that the transmitter outputs in the schematics are "old-fashioned."
What I mean is, they don't show 50 ohm or even coaxial-type ouputs. Instead, they just show the two leads which are supposed to connect to the antenna.

How can you tell what type of antenna is intended? Impedance? Type of feedline? There is no mention of it, so I guess it was common knowledge, at the time, as to how to couple the antenna, and what impedance of antenna you would use.

I'm just used to more modern circuit diagrams, showing the usual co-axial, low impedance output. With those, you pretty much can presume they're looking for around 50 ohms. How about with the older tx schematics?

Many thanks,

JWG

Hi Gary--

Looking down at my log from a few nights ago, I see LZ1QI, FP6ECS, YU1XA, and S59A--all worked around 10 PM on SSB using an MFJ-9475 running 12 Watts into an inverted V. It is indeed possible to work 75 at night--as long as you aren't having to blast through jammers making animal noises and burping into the microphone. I get on 3936 with friends most nights before dinner, and at that time of day, I can work anyting you can hear on 10 Watts. Of course, if you want to check into the trader net on 3898 later on, forget it--and when the band is that bad, 100 Watts won't cut it either! But, I've been doing QRP on 75 for several years, and I am continually amazed at how well it DOES work--especially if you have a good antenna.

anyone got circuit details /pot references?
anyone ever adjusted tube positioning?
not completely broken-just needs focus adjustment.

Its a 1980's type 2/3inch spectraplex vidicon with
pistol grip & 10-pin cable plug(as used with older vcrs &
large over-the-sholder VHS portapacks.)

Will pay for reprographics cost incurred.

email please to: jj56@dial.pipex.com

While I don't doubt your success, you've also never had some lid, or oldtimer who can't hear anything, key right up on your QSO, or 1KHz away, and ignore your statements that the frequency was in use, except to laugh later about that squeaky signal about 10 minutes ago. QRN is a problem, but QRM as Gary said is even more of one. 73 de n8blk/3 -art clemons-

> fun trying.

Once I was waiting in line at a Pizza Hut and talking simplex to a friend
at
the other end of the mall. I noticed that whenever I keyed up the cash
register
beeped. When I got right near it I keyed up to ask my friend what she
wanted
and the register display went BLANK. Actually I crashed the entire system.
Did you know all the register were interconnected? I didn't. When they
restarted the system it insisted on printing the day end receipts which
took
quite some time. Despite them seeing me key up they had absolutely no
idea I caused the problem. I have since refrained from using the ht near
electronic equipment that has the possibility of delaying lunch.

My understanding is that the purpose of the gold is to suppress
emission from the tungsten grid material which can get quite hot.
Vaporiing the gold messes up the emission of the cathode and can cause
HV hold-off problems by getting on the tube envelope.

My experience is limited to some small planar triodes with 2 to 3 cm
sq cathodes and grids that are only a few mils off the cathode. the
anode cathode spacing is about 0.1" . The tubes operate at 8 - 9 kV
and can put out 20-30 kW (pulsed). They are about 1"diam X 1" long
and require an external heatsink.

If anyone is interested the tubes are YU-141 and YU-176. I have made
360 kW amplifiers at 425 MHZ, 1% duty factor with 12 of these guys in
parallel. They are so closely spaced that transit time is not a factor
at 425 MHz and I have seen up to 60% efficiency with careful tuning.

I am looking for a frequency synthesizer chip like the MC145163.
It appeared in an article in the June 1991 QEX, page 22.
I have searched the Motorola web site, and the only one that
appears to come close to it is the MC145170, but it is a serial
interface, not BCD. I want to use BCD thumb-wheel encoders
with it. So I guess I am looking for a source for the MC145163
or the part number for an equivalent chip.

Thank you,
Steve

<SNIP>

There was one more correction in the Nov 91 issue, page 15.
The wire you are talking about should not connect with the + line
by the 6800 pf 10kv cap (UES1306 anode), just remove that "dot" on
the schematic.

ï¿½ Jim: I recently opened a kaput, 8877 that experienced both of these
problems during operation in an HF amplifier. Before the fatal
gold-sputtering episode took place, the dc grid current was reportedly
normal. Since the 8877's gold-plated grid can handle over 40a-rms of RF
grid current @250MHz, it does not seem likely that normal grid currents
could be responsible for the gold-sputtering that destroyed the tube.

ï¿½ Interesting.
Are the YU-141 and YU-176 similar to the Y-518? What are the anode
dissipation ratings and heater requirements for the YU-141 and YU-176?
thanks, Jim.

Great idea Gary, but it defaces the rig. No help when bowwowing Joe's rig on field day. An easy fix is to make up a small buffer amplifier using a single transistor, e.g. BF981 or a modamp, operating in a linear mode (most important) to boost the low power to about 20mW. Then add a filter on the output to ensure a clean drive.

A level setting pot is a good idea as well so you can adjust the power input to the transverter, and while you are at it, a relay and two sockets to switch the receive line and the signal to the transverter pin on the acc1 connector.

Now you can leave the rig wired for HF and have the transverter connected. Change bands at the flick of a switch and protect the transverter from 100W of HF.

Hi All,

Bought a Cleartone CM6500 PMR set at the weekend, very cheaply too, just wondering if it's possible to mod the radio into the 70cm's band, and also where I can find any information to do this. Unfortunately, there is nothing obvious inside like a diode matrix or Eprom, so any help would be gratefully accepted.

Thanks in advance and 73's de G7UOZ, Max.

Mike,
This is a matter of a simple IF filter replacement for most
scanners. Although wideband IF filters are not available at your local
Radio Shack, they are available from several mail order places. A
detailed description on how to do this appears in the Weather Satellite
Handbook by Taggart.

Are you into HOT CHAT? We've got the world's largest voice-personal dating system, as well as the hottest, sexiest "1 on 1", "2 on 1", and "PARTY-LINE" chat you'll find anywhere, all in one place! And you don't have to call a 900 number to get in on this hot phone fun!

You can choose from 5 hot programs that are sure to fulfill your every desire!

You can press 1 from the main menu to choose from our sexy "1 ON 1" PLEASURE MENU, then:
*to talk to a BEAUTIFUL SEXY GIRL, press 1.
*for a 1 on 1 session with an experienced DOMINANT MISTRESS, press 2.
*for steamy talk with a LUSCIOUS TRANSVESTITE, press 3.
*for an erotic 1 on 1 chat with an EXOTIC TRANSSEXUAL, press 4.

*for some man to man action with a HOT GUY, press 5.
You'll be billed just $3.99 per minute for your selection.

Or you can press 2 from the main menu to DOUBLE YOUR PLEASURE, then:
*to speak to 2 HOT SEXY GIRLS, press 1.
*to get it on with a swinging WILD COUPLE, press 2.
You'll be billed just $4.99 per minute for your selection.

Or you can press 3 from the main menu to join the GROUP ORGY LINE!
*You can party with the nations nastiest swingers for only $2.50 per minute.

Or you can press 4 from the main menu, then:
*Press 1 to join the FANTASY NETWORK. This is the world's only phone service that allows you to connect with people who share your personal fantasies. This state-of-the-art voice mail system lets you listen to messages from beautiful girls, sexy transvestites and she-males, gay and bisexual males, and dominant women. Leave them a hot and sexy message, then call back to see what erotic message they have left for you. You'll be billed just $3.50 per minute.
*Or press 2 to listen to a hot selection of recorded fantasies steamy enough to make you explode! Choose from beautiful, sexy women's fantasies or domination stories. You'll be billed just $2.49 per minute.

Or you can press 5 from the main menu for the HOT AND NASTY DATELINE, where you can listen, and respond, to voice personal ads from hot horny girls in your neighborhood, including their real names and home telephone numbers! You can also leave your own personal message for people to get in touch with you. Make new friends on the world's busiest voice personal lines! Meet singles or couples, gay or straight; you'll be billed only $2.99 per minute.

***JUST CALL 1-800-756-3906 to use your Mastercard, Visa, or American Express card. The charge is just $2.49-$4.99 per minute, plus a 50 cent connection fee. 18+ only.

***OR CALL 1-900-745-4398. The charge is just $2.49-$4.99 per minute. Must be 18 years of age or older.

I have (2) 10Ghz alarm motion detector units. I took them apart to see what was inside. There is a cavity with the Gunn? diode, a waveguide port and on the other side is a cover that had what looked like black conductive foam for storing CMOS IC's. It was very dry and crumbled away. Oooops

What is the purpose of this foam? Is it neccessary for the proper operation of the cavity? Is it like a dummy load in the cavity?

I don't know what kind of power these put out but I guess its in the 1 mW range??? I have established contact between the 2 units at 20 feet (this is without any additional waveguide extensions or parabolic dishes)

Are there any Web sites of interest for 10Ghz stuff?

Thanks
Tim KF8XW

I repaired a Johnson matchbox (275W version). I don't know the correct
place for the input coil tap. I have it placed slightly more than two
turns from the ground side of the coil. (the other end is left open).
This tap is made by soldering a wire from the coax input connector. I
don't need to know the tap for a second receiver, that tap is adjustable
and is closer to the open end.
Thanks in advance,
Shel Darack WA2UBK shel@lucent.com

That's because it isn't science, it's religion. The conversation can't possibly be held to technical issues when personal opinion attacks are made against manufacturers and other people on a regular basis, and when a participant constantly presents false or corrupt data or half truths as fact.

But getting back to technical issues.

In article <measures-ya02408000R0402970132530001@news.vcnet.com>, measures@mail.vcnet.com (R. L. Measures) writes:

>In other words, the arcing that destroyed the original bandswitch and
>the replacement bandswitch in Rick May's AL-80 can not be explained by a load
>fault. The only thing that was altered after bandswitch #3 was the
>VHF-Rp of the VHF suppressor in the AL-80.

Measure then claims....

>The original suppressor has an Rp of
>about 166 ohms at the anode resonant frequency of 160MHz.

That's the stock suppressor, 166 ohms (by the way 160 MHz is NOT the frequency an AL-80 oscillates at if the suppresor is removed).

>The replacement suppressor has an Rp that is around 101 ohms at 160MHz.

That's his nichrome suppressor, 101 ohms.

>Since voltage gain is essentially Mu*Rp, decreasing VHF-Rp decreases VHF voltage gain.

Rich is very plainly claiming LOWERING parallel (Rp he calls it) resistance of the
suppressor will decrease VHF gain and increase VHF stability. He cites that as
proof damage was from a parasitic.

We can deduce the following:

1.) If a lower Rp suppressor (such as in the suppressor Measures touts) results in more system stability, the ultimate reduction in Rp will occur with a dead short for a suppressor.

2.) If Measures is correct in his claims, the highest Rp would result from an open anode lead, or a very high resistance in series with the anode lead.

According to Measure's theory, if we connect a 5000 ohm resistor in series with the anode it would make the PA less stable than with a zero ohm series resistor. From that we can conclude removing suppressors from equipment and replacing them with shorts will result in maximum VHF gain reduction and maximum stability.

We all know this is untrue. The reason why the higher resistance value of Rp increases stability is because it is part of a larger system that has a finite impedance larger than zero ohms.

The only case where his suppressor would help is if the impedance of the anode path is very low, and the original suppressor has an even lower Rp than his suppressor. In the case of the AL-80, Rich's suppressor actually decreased stability....you can bet on it.

There is absolutely no technical reason for using nichrome, since even the slightest adjustment in inductance and resistance in a convetional suppressor will produce much more predictable results. The correct way to go is to increase the parallel impedance and resistance of the suppressor, not decrease it, if we need more stability.

In article <32FFD7D6.3F27@csrlink.net>, Jerry Booth <jerryjtb@csrlink.net>
writes:

>Any of you men want to talk with BUZZ ??? He works with me at Litton
>Electron Devices in Williamsport, Pa. He is the engineering manager and
>very good one I might add. Helped him put up his vhf/uhf antennas when
>he moved here.
>Jerry W0ZD

Jerry,

Rich KNOWS what Buzz does because Rich called around and checked up on
him. :-) You must be mistaken.

Actually to bring you up to speed, here's what happened. At first I tried
to leave names out and just told Rich no one at Eimac agreed with him.
Finally when he kept pressing for who disagreed, I mentioned Buzz as one
of the people (after checking with Buzz first).

I said:
In article <19961127002400.TAA17657@ladder01.news.aol.com>,
w8jitom@aol.com writes:
>The former *R+D engineering manager*, Buzz Miklos, of the Salt Lake City
>Varian plant has agreed to speak to one or two people on the telephone
>about your theories. He said he will also come on line, but since he just
>took a position as engineering manager with another tube manufacturer in
>PA, it will be sometime in January before he is able to connect directly
>to this newsgroup.
>Mr. Miklos feels, and says his Eimac engineering staff felt, your
theories
>have no merit and display a complete misunderstanding of how a power grid
>tube operates and the mechanisms of tube failures.
>He prefers you not receive his phone number, since he understands you
have
>more time to argue than he does.

That was a direct relay of what Buzz said. That kicked it off, then
Measures responded....

In article <measures-1512960143130001@term1-13.vta.west.net>,
measures@mail.vcnet.com (R.L. Measures) writes:
>
>Mr. Rauch told us "that Mr. Miklos was indeed R+D engineering manager for
>Varian". I telephoned the Personnel Department at Varian-Eimac's Salt
>Lake City plant. They told me that Mr. Joseph 'Buzz' Miklos' title was
>"Engineer B". They assured me that Mr. Miklos was not the R and D

>Engineering Manager. I posted the information here.
>
>RE: "I have no more time for arguements..." :
> Translation: Having been caught adjusting the truth about Mr. Miklos'
>position at Varian, Mr Rauch seems to have abandoned the very debate that
>he desired since 1990.

You see, Measures accused me of lying.

In article <measures-ya023180001312961029260001@news.vcnet.com>,
measures@mail.vcnet.com (R. L. Measures) writes:

>I have little hope that Mr. Rauch will ever take anything seriously if it
>contradicts his dicta.

>Consider the case of Buzz Miklos, who used to work at
>Eimac-Varian's Salt Lake City plant. Mr. Rauch told us "that Mr. Miklos
>was indeed R+D engineering manager for Varian". However, when I
telephoned
>the personnel department at the Salt Lake City plant, they told me that
>Mr. Joseph 'Buzz' Miklos' title was "Engineer B"---and they assured me
that
>Mr. Miklos was NOT the R and D Engineering Manager.

In article <measures-0301971716380001@port10.vcnet.com>,
measures@mail.vcnet.com (R. L. Measures) writes:

>Here we are in January already, and we still don't know who Eimac's Mr.
>XXX is. However, we should soon be hearing from Mr. Joseph P. "Buzz"
>Miklos who reportedly disagrees completely with me, but whose CV seems to
>disagree with Eimac's personnel records of his past employment.

And as you see, Mr. Measures assured everyone he "checked Buzz out" and
that Buzz was never R+D Manager at Varian Salt Lake. Measures implication
is that Buzz was an engineer grade B, and that I was just a liar who made
up stuff about Buzz being a qualified expert on power grid tubes.

In a letter to QST (that I have a copy of), Measures states an engineer at
Eimac is "someone who cleans bathrooms" in order to dismiss claims of
engineers at Eimac who disagree with him.

While you and I may hold Buzz (and other qualified engineers like Buzz) in
high esteem, Rich thinks (and even wrote to QST) they are people who
"clean toilets" for a living. But I'm sure that's only when they disagree
with Mr. Measures.

I do not operate QRP per se. However, I do build a lot of radio equipment and through experience have found that including a high power amplifier has not been necessary.

The 75M band is open 24 hours a day, 365 days a year.

The difference in signal strength between 1KW and 10W power level is 20dB.

Yes, there are times when conditions can be difficult, however, then the QRO ops throw in the towell too.

> tubes function in the circuit?

Joel-

Back in the 60's, several of my friends had the Lafayette HE-45A, when they were a current model. They all had the same low modulation problem. You might be more successful by taking the approach of looking for a design deficiency, rather than trying to fix a "broken" radio!

I always wanted to get my hands on one of them, to see if I could figure out where the problem was. I would have tried feeding the microphone circuit with an audio oscillator, and looking at the audio stages with a scope.

The first test, would be to increase the audio level until the modulator started to saturate, and see if it was capable of close to 100% modulation. If not, and an earlier stage didn't saturate first, then the modulation transformer turns ratio might be incorrect. As I recall, it used a tapped, single-winding modulation transformer, in an "autotransformer" configuration. (I don't remember if they used the same stage for receive audio. If so, then there may have been an additional speaker winding.)

If the modulator is capable of close to 100% modulation, then it may be possible to change load resistor values in the earlier stages, to increase voltage gain.

At least in theory, the modulator should have been capable of producing enough audio to come close to 100% modulation. I don't recognize the tube number 7868. It may have been a tube used in the newer "B" model, in an attempt to increase modulation. I think the older one used a 6AQ5.

Keep in mind that hearing is logarithmic, and most people's voices only reach an occasional peak without speech processing. A rule-of-thumb, is that average speach is 10 dB below the peaks, for "broadcast quality". Most two-way radios are set up so that voice peaks are limited, and average modulation is relatively high (maybe 50%). If it sounds weak compared to other signals, it is probably quite low in terms of average percentage.

Most older transmitter designs employed link coupling to ladder line.
The loading was controlled by varying the coupling of the link to the
output tank. So these transmitters weren't designed for any specific
load impedance. An amateur was expected to adjust the link to match
whatever load he had to feed.

Today is usesd my scanner Bearcat UBC 9000 XLT and the program WXSAT
(soundblaster) to receive NOAA pictures.
It works GREAT !!! I get the compleet pictures, a friend of me have a
real NOAA receiver and we putt the two pictures together and they are
the same. So my scanner works great to receive weather sattelites on
+137 Mhz.

No modifications on my scanner, and i use a normal dualband antenne for
144 Mhz and 440 Mhz.

Hi Mark,

Rather than asking for "schematics" on the internet, I suggest you
will have much better luck looking in appropriate magazines and
handbooks for transmitter construction projects. A schematic, by
itself, if of little use in building a VHF transmitter. Mechanical
arrangement of the parts is critical also. Look in any ARRL handbook in
recent decades for starters. Why this is so will also be explained to
you as you educate yourself by reading about transmitters in general, in
these books. The internet will never be a substitute for studying and
READING to learn about a subject. It takes effort to learn enough
so that you can then ask specific questions.

Could someone please offer a beginners' explanation as to how a crystal
determines the freq in an oscillator?

It would seem that a crystal would not allow current to pass, or at least
dc anyway, so doesn't it "look" like an open circuit?
Or does the crystal only pass currents at its precise resonant frequency?

The whole point of an oscillator is that some of the output is fed back
into the input circuit. This results in oscillation. OK,
but what's to say that the freq of oscillation corresponds to the crystal
freq.??

Thank you for any info on this.

1680. Re: How do Xtals determine transmitter frequency??

Source record: 97383

OK, here's a very simplified description of the forces at work. A crystal is nothing more that a finely produced slab of quartz whose dimensions and crystalline structure have been engineered to have a mechanical resonance at some frequency. Electrodes are plated onto the flat faces of this quartz slab. What's unique about the quartz crystal is that a voltage applied to the electrodes will cause the mechanical structure to "warp" slightly. When the voltage is removed, the quartz relaxes to its original position, and generates an opposite voltage across the electrodes. The quartz is "giving back" the energy which was appplied to it. Since the mechanical structure of the quartz doesn't react to this stimulus instantly, but has some well defined inertia, there exists a "magic" stimulation rate at which the quartz will give back its stored energy at precisely the same rate at which it is tickled. This is the resonant frequency of the crystal (the series resonant frequency, to be precise). At resonance, the crystal is vibrating in synchronism with the stimulating AC signal, and AC currents will pass across the quartz with very little attenuation. The electrical equivalent is a series resonant LC circuit.

A crystal oscillator is, like all oscillators, nothing more that an amplifier with a feedback path which applies some of the output signal back to the input in the correct phase relationship to sustain oscillation. If the feedback is made frequency selective, there will be only one frequency at which the feedback produces the correct phase relationship for oscillation. This is the oscillation frequency. If a crystal is inserted in the feedback path, then the crystal, acting like an LC resonant circuit, will determine the oscillation frequency.

Having said all that, don't be surprised when you run out and try to build a crystal oscillator and find out that it doesn't work as expected. This simple explanation of crystal behavior is idealized, and doesn't account for losses in the quartz, electrode parasitic capacitance, or overtone resonances in the quartz. The circuit topology is also a big factor to getting expected results from a crystal.

Message-ID: <5dqmfb$2mr@esgadm.esg.mk.com>
Source record: 97386

I have (2) 10Ghz alarm motion detector units. I took them apart to see what was inside. There is a cavity with the Gunn? diode, a waveguide port and on the other side is a cover that had what looked like black conductive foam for storing CMOS IC's. It was very dry and crumbled away. Oooops

What is the purpose of this foam? Is it neccessary for the proper operation of the cavity? Is it like a dummy load in the cavity?

I don't know what kind of power these put out but I guess its in the 1 mW range??? I have established contact between the 2 units at 20 feet (this is without any additional waveguide extensions or parabolic dishes)

Are there any Web sites of interest for 10Ghz stuff?

Thanks
Tim KF8XW

Another way is to connect the cold end of both coils to ground through a
common lead, ground the cold end of the tuning caps directly. This
creates a small amount of mutual coupling. The 1967 handbook shows this
used in the front end of a receiver.

I've just had a couple glasses of wine, otherwise I'd attempt an answer. I suppose you are a ham. You should have a copy of the ARRL handbook. (IF you don't, get one!) Look up the chapter on oscillators. You should find the chapter listed in the index. I goes into oscillator theory in depth, but in a clear manner for you to understand.

I would love to hear from anyone interested in this subject. I am actively working on finding/building devices to use this band.

I'm supprised as well, and I'm *very* interested in this development! At the very least, I want a transceiver pair to experiment with a friend, 1.5 miles away (let alone my ISP, which is 3 miles away...). I'm picturing a transmitter/receiver interfaced to an Ethernet card in a pc, either via the AUI or TP ports. This shouldn't be too expensive, and would be of windfall benefit to have a 10Mbps Ethernet connection to the Internet!!! (Ethernet encoding requires 20Mbps bandwidth to deliver 10Mbps data throughput) The telcos won't be bringing us anything near this speed for a long time, and even then it will be outragiously priced. Cable TV companies won't do any better (except for isolated pockets), and again, they're overpriced. TCI receintly announced a big scale-back of their Internet efforts. Free airwaves are the way to go for a 'free' Internet! Talk about bypass!!! I love it for being able to give a thumbed nose and raspberry (complete with wiggling fingers!) to those that should have already provided us with reasonably priced, high speed communications. Such was the spirit that gave birth to MCI and countless (well, hundreds anyway) telcos and long distance carriers. RBOC's fear of losing overpriced leased line suibscribership has and will (IMHO) keep them from delivering high speed comms, allowing their lunch to be eaten (again!!!)!

Please contact me if you have knowledge of or interest in this NII development, equipment to use it, as well as the implied opportunities.

1690. Twisted pair in place of coax?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-12 00:00:00 UTC
From: rohrwerk@pcOnline.com
Message-ID: <rohrwerk-1102972302370001@tsc-p21.pconline.com>
Source record: 97443

In a few references accompanying Rick Campbell's R2/T2 projects, he referred to the possibility of using twisted-pair wiring for some of the RF connections within a project. Based on this cue, I have used it quite frequently now at HF -- tightly twisted small enameled wire is sure a lot easier to solder and move into place in tight quarters. From empirical evidence, things seem to work fine even with some runs of 6-8 inches.

Obviously a twisted pair is a transmission line, but I'm surprised it seems to work tolerably even with unbalanced signals.

Anybody know the limits of this approach? Surely in some situations the shielding would not be sufficient.

In addition, one reference said, "For the ultimate in engineering elegance, place a ferrite bead in the middle of the twisted pair." How does that little bit of ferrite help the situation?

I don't know the Y-518. as far as I know the YU-141 and YU-176 are the highest power planar triodes made by Eimac. The YU-141 is somewhat similar to the 8941 (which I have also used at 425 MHz), except it has a coaxial base and a longer external arc path. The YU-176 is a scale up of the YU-141 by 150%.

YU-141 6.3 V at 2.225 A heater, Up to 800 W anode dissipation, depending on cooling, 2 W grid dissipation. 20 kW peak power at 1% duty factor (100 us pulse), useful to 2 GHz

YU-176 6.3 V at 3.80 A heater, Up to 800 W anode dissipation, dpending on cooling, 2 W grid disipation, 30 kW peak power at 1% duty factor (100 us pulse), useful to 1.5 GHz.

"Depending on cooler" is an interesting statement. I once tested a YU-176 at 2 kW dissipation with a specially designed anode cooler.

The real limitation is the grid dissipation. The main heat conduction path is the grid support wires. One of the really interesting things about these tubes is that the gain goes way up in low power operation.

A typical am[plifier lineup is Solid State Amplifier to 150 W, one-tube amplifier to 3 kW, 2 tube amplifier to 36 kW, 12 tube amplifier to 360 kW. Or 13 dB gain, 11 dB gain, 10 dB gain. That is conservative. What is observed is 15 dB gain, 13 dB gain and 11 dB gain, all tuning dependent, of course.

Some failure were experienced early on and we disassemble a fairly large number of tubes. Some had holes blown in the grid from too muuch energy in an internal arc. There were ome instances where you couls see that an internal arc had "blown" off the gold, but not punctured the grid. But the most curious thing was that many of the cathodes had a large number of black specs. The engineer speculated that this was a

sign of "parasitic oscillations." I, as t he ampliifer designer and tester, was pretty certain that their were no parasitic oscillations occuring. We finally came up with a mechanism that explained the black specs, although we never tried to prove it. The ampliifer drives an accelerator, which is basically a high Q resonat circuit (like loaded Q = 3000 or so). At the end of the pulse, the energy in the cavity (about 1 joule) comes out of the avity making a big spike in the reflected power. The line length is designed so that this produces a low rf voltage at the anode. But, the resonant cavity looks like a shot circuit at frequencies not close to its resonance. The transmission line was 3-1/8" coax.The coax line has resonances which have fairly high Q because there is no mechanism to absorb their energy. These modes an be excited by the turn off trnasient perhaps, or by a park in the resonant cavity. We believe that some of the modes could have made a high voltage at the tube anode. The tube would break down in a "microdisharge" causing slight damage to the cathode, but not otherwise hurting the tube because the energy was very low. The anode resonant was exteremely tightly coupled to the coax (loade Q of about 10) so it had enough bandwidth to permit high voltages to develop at some of the nearby transmission line modes. (The modes occur at whatever frequency the line is an odd multiple of 1/4 wavelength, in the approximation that the anode end is open and the load cavity end is shorted. There is really some reactance at both ends, so this statment is no exactly true, but the point is that the longer the line the closer the mode spacing.

I don't think that this mechaism is the high frequency amplifier fault mechanism described in this thread because the power levels and energy are probably too low.

I mention it only to cite an example where parasitics were blamed for a more subtle problem. But, I do not doubt that the Eimac engineers had seen instances where high peak voltages due to parasitic bursts had caused that type of cathode damage.

Doug - I think the best solution is to obtain one of those really old AM CBs which used crystal control. One I have for 28 MHz AM used six 37 MHz crystals mixed with a bank of four 10 MHz xtals to produce 23 channels on 27 MHz. I replaced one of the 37 MHz xtals and re-tuned the radio for 4w out on four 28 MHz freqs. Best DX so far was 900-1000km with that rig and a mobile whip.

Alternatively, one of those 27 meg CB handhelds (like Tandy sells) with an appropriate xtal for your frequency would do the job. Add a PNP transistor to switch the supply to the PA - this is for your keying.

Of course you could convert a synthesised CB, but this is a bit of an overkill for one frequency. Also, newer sets are harder to convert to 10 m.

Joel - What you probably need is some form of L network to convert the collector impedence to 50 ohms followed by a pi network LPF. Solid State Design for the Radio Amateur gives a very good coverage of the component values required - this
depends on the collector impedence which depends on the supply voltage, and collector current. Alternatively, for higher powers, you may need a 4:1 balun or similar to match to 50 ohms. Follow this by the usual pi network.

The foam is a load to aid stability. The power output can be more say
10mW. You can frequency modulate them with the power supply voltage and
usually tune them to the 10 GHz band. Such units were popular in the
early 80s for wideband QSOs. They are little use now unless you are
in to 1 way contacts. Ranges of 100km were possible with small dish
aerials.

Have you tried PW Dhal? the component you are after is rare, very rare.
Most people use a stack of electrolytics or a pair of the marginally
less rare 3kV 100uF oil filled capacitors.

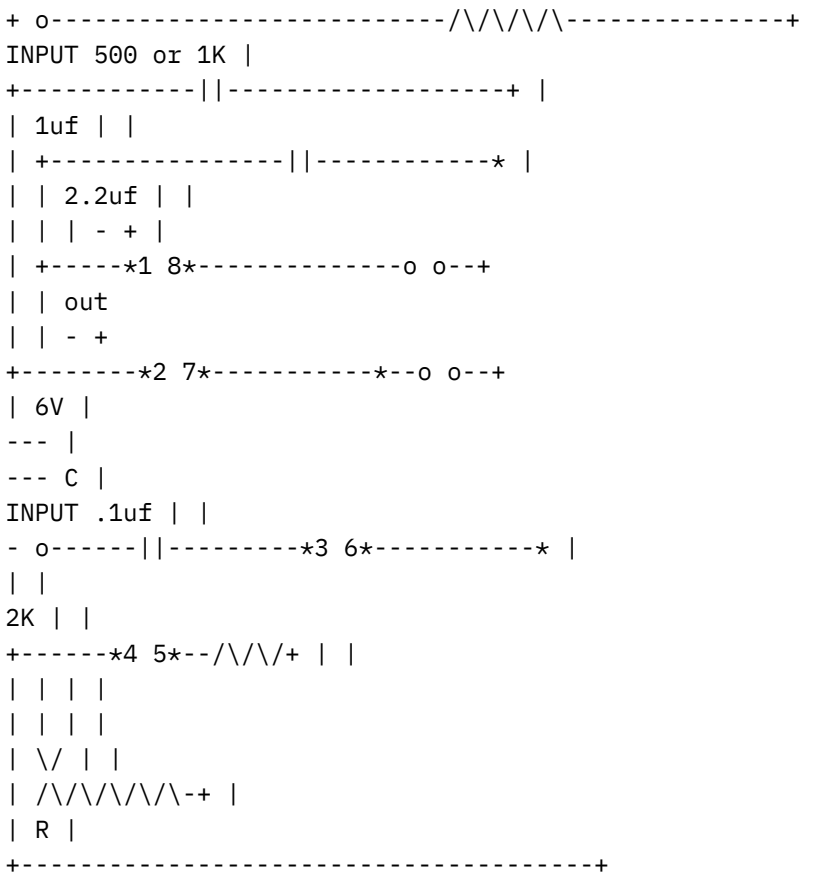
1698. 567 tone decoder chip

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-12 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <5dri7b$n2q@news.Hawaii.Edu>
Source record: 97451

I picked up a couple 567 ICs and want to use one for a 1050 Hz tone
decoder (that's the National Weather Service's alert tone). The
decoder circuit I've come across is as follows:



500-1k Resistor: 1K for 3.5 mA, 500 ohms for more (no more than 100 mA)
R: 20-25K
C: .022 uF
Center freq = f = 1.1 / RC
Bandwidth < 14% of f

So the bandwidth should be less than 140 Hz at 1050 Hz.
Is this the standard circuit for the 567 or does someone have one
that will provide less bandwidth? How stable can I expect the decoder
to be?

Thanks in advance,
Jeff KH2PZ

Rich,

Enough is enough. Now you are telling some poor guy trying to ask a legit
question a 8877 grid can handle 40 amperes RMS current without damage.

It's time to come back to earth.

Warning. Never run 40 amperes of grid current in a 8877, as a matter of
fact, never run 0.40 amperes of grid current, or you will ruin the tube in
very short order.

If you doubt me, call the manufacturer.

My .02
I have built a variety of electronic equipment and in my experience
getting parts, making PCBs, aligning the units take time and try my patience and
negotiation skills. This is not due to the exitement of building, but due to lack
of resources in obtaining some parts, $$$, getting access to alignment test gear
and oscilloscopes. Also when ordering parts you are normally requirted to buy a
quantity of 25 before some suppliers will talk to you. For example; try buying a
82c55 in a PLCC package , or a 29c256 flash device. Its a battle!

Expecially, when I call the same suppliers representing my company, then they
perform backsprings better than any circus performer. As a HAM they will not touch
me. Being ethical I won't abuse, so I'm stuck seeing two sides to a coin.

Therefore I have happily resolved to purchasing good quality KITs (TENTEC, RAMSEY,
etc..). I also get a real kick at hamfests when I can purchase a kit that someone
else has tried to build. The kits are easy to build and have been proven in. You
may want to consider this when building you own. The learning experience, and
exitement of building it is still there as well. As far as schematics go
RADIO Electronice had a 2M project a few years ago. Also your local library
that carries QST, QEX may give you leads as well.

Cheers
Gabe, Ve3slj.

I often bring along WBFM compatible 10 GHz gear in case someone
wants a contact. I've worked as far as 200 km with 20 dBi horn
antennas,and don't consider 130 km contacts all that unusual.
I've just starting bringing along the 24 GHz gear too.
--Zack Lau W1VT Usual summer fall spot is FN33kd, but have
also made 10 GHz contacts from FN20/31/32/33/42/43/44.

The circuit uses a small voltage generated via the piezeoelectric effect of
the application of voltage accross the crystal element while it is under
pressure in the holder.

If an 8877 is being operated at Eimac's maximum rating of 4kV and 250MHz,
the RF grid current is 2650v-rms/ 63.66 ohms = 41.63 amperes rms.

Richard Karlquist (rkarlqu@scd.hp.com) wrote:
: You see this written from time to time. I happen to disagree with
: this opinion, as a general matter. It sounds reasonable to drive
: mixers with a square wave since one is trying to switch the diodes
: on and off. The reality is that square waves do not go through
: transformers very well, so you should really stick with a sine
: wave in most cases. What really makes mixers happy (at least
: below 100 MHz.) is to be driving from a current source of sine
: wave.

Correct me if I'm wrong. But I thought that, in a double balanced
mixer, only the RF & IF ports were fed thru transformers, not the
LO.

: Another problem with square wave drive is that if you don't make
: the duty cycle exactly 50%, you degrade the mixer performance.
: It's easier to make a distortionless sine wave (with a low pass
: filter) than a perfect square wave.

It's been a while, but I recall once having trouble with a DDS
based LO. The DAC in the DDS was generating alot of quantization
spurs. Rather than try to get a high speed umpteen bit DAC I just
used, effectively, a 1 bit DAC, which can run comfortably at a
very high speed. And nothing is more linear than a 1 bit DAC
(nothing digital anyway). Feeding this to the LO port of the
mixer, the end result was alot cleaner.

I am currently looking for some filter caps, 450 WVDC or higher, and more
than 100 ufd. I have an old RF amplifier that has 7 of these in series
with a 20Kohm, 10 watt resistor across each for balancing and bleeding
purposes. They are connected across a 2500 VDC power supply. This is
a pretty standard design and probably what the guy needs to do. I've
been looking for a source to replace my caps with but haven't been able
to find much available in axial leaded electrolytics that are rated 450
WVDC and significantly higher than 100 ufd. Even then, they are more
than $10.00 each new. Does anybody have a good source for new or used
high voltage caps?

I see no mention of the lack of SELECTIVITY in any answer to the initial
question. How can one ever separate stations, except, perhaps with a
YAGI to do it by direction of the transmitter? With a Q of 400 at 80
MHz the bandwidth is going to a half megahertz, with awful skirts. You
would hear the entire band at one time if everybodys signal arrived at

the same rf level. I do agree, there is a chance to hear "something",
but what?

>does that little bit of ferrite help the situation?
>
>John Seboldt K0JD

The little bit of ferrite acts as a choke to the common-mode currents without affecting the differential-mode currents. This forces the twisted pair to act like a non-radiating transmission line, which is the desired effect. A single bead may not provide enough impedance to make this happen, but 5-10 turns through a typical core almost certainly will. For the HF range, use 70-series or type 43 ferrite (Fair-Rite/Amidon designations) for the greatest impedance.

This is exactly what a "choke" or "current" balun does.

The "shielding", that is the insensitivity to undesired signals, will be a function of how well the common-mode signals are attenuated and how intimately the fields of the differential signals on the wires are linked. There's no way to put an absolute limit on the applicability of this approach, since it depends on how sensitive your particular circuit is to incoming radiation or coupling to other circuits, or how sensitive other circuits are to its radiating. It's a valid approach for many applications.

>
>73 Mike

Well, you can certainly do that, Mike. But 1) I don't consider adding
a jack to the back panel "defacing" the rig, and 2) if I'm borrowing
the rig it only takes a couple of minutes to remove the cover and move
the transverter cable over to the pre-driver output jack, and another
couple minutes to put it back when I'm done. No *permanent* changes are
required. This is the quickest, easiest, and cheapest way to allow the
IC735 to work with 10mW input transverters.

I'd use an external box only if it were imperative that neither radio
nor transverter be touched internally. In that case, your idea is an
excellent one. I'd likely use a MAR-4 as the gain element. Note that
you *could* tuck one of these *inside* the 735 or *inside* the transverter
as alternatives. That wouldn't "deface" either piece of equipment, and
eliminates another external box and another level of TR sequencing.

If you're using transverters with a transceive IF port, the best place
to put the extra amp is inside the transverter on the Tx side *after*
the transverter's internal TR. If you're using a transverter with a
split IF, many are this way, then putting the amp in the radio to bring
it up to "standard" transverter levels might make more sense. Especially
if you want to mast mount the transverter, then having the hotter signal
at the other end of the coax becomes very attractive.

There's nothing *wrong* with your approach, it is just that I'm reluctant to build yet another box when I don't have to. That's just more stuff you have to lug along, and another set of cables to add to the tangle, and possibly cause problems, and another level of TR switching to sequence.

Can I replace the Foam with some regular conductive black foam?

I am curious to try this band out but (as you've indicated) don't want to spend cash for Down East Microwave or other narrow band gear just yet. I'm sure I could get others from the local club to "co-Operate" with me on this band. I've got a Primestar 3 ft dish to use.

I gather the signals will be wideband (100 khz-more ??) and would not be desired in the narrow band 10 Ghz DX window (does this exist or is 3cm a free for all?). I live in semi rural Ohio. I don't know of any activity on this band but I'm sure it exists. 200Km=120 mile radius from Akron... = Columbus to Detroit to Canada across lake to Pittsburgh, PA to Charleston, WV. There must be someone in that area on 3 cm.

Thanks
Tim KF8XW

> Thanks,
> Sam KF4GQS

Sam, this is an easy conversion. Basically all you have to do is change the channel element crystals and retune the radio. Most of the Mastr II radios you'll find will be operating in the 450-470 MHz range. They'll tune right down into 440-450 MHz with no problem. If you have one that is for 470-512 MHz, then you've got problems. The receiver front end filters won't tune down into the amateur band, so you have to replace them. That's a major job, and you'll be better off looking for another radio.

The first step is to assemble the radio, cables, and control head into a working system on the commercial frequency. Once you have everything checked out, order a set of crystals for the amateur band, put them in, and follow the tune up instructions in the manual. (If you don't have a manual, get one. It will tell you everything you'll ever need to know about the radio.)

These are excellent radios, and well worth the trouble to convert. Many of them serve as repeaters, my repeater uses one, and lots of them are used for base stations or trunk mount mobile operation.

: but what?

Um, I think it would be 200kHz for a simple single resonator. But if the goal is to listen to the pilot of the commercial plane you are on (where you may not have any electronics turned on at certain times, but seems like such a crystal radio would be OK), then selectivity isn't important at all.

(This hypothetical single-tuned circuit would be about 3dB down 100kHz away from center, 20dB down 1MHz away, 40dB down 10MHz away...)

If you did want some selectivity, you could use a more complicated filter--things would get big fast, but helical resonators in 8cm diameter shields can yield unloaded Q's up around 2000 at 100MHz frequencies, and a set of three of those could conceivably make a decent filter if your "band" isn't too crowded. Remember, this receiver won't be all that sensitive anyway. If such a three-pole filter were 200kHz wide, then the numbers from above would be more like 60dB down 1MHz away, which isn't so terrible. Very difficult to tune over much range though!

As with most engineering, it's a set of tradeoffs. There could be an advantage to such a "zero power" receiver that outweighs the many disadvantages.

It is for a "synthesized VFO" covering about 5 MHz using only
that chip and about 4 transistors. It uses BCD "thumbwheel"
switches to select the frequency.

I always thought that a circuit like this would be duplicated
hundreds of times over in magazines, but it is almost as if
the magazines have a ban on it.

Wouldn't every homebrewer want a rock solid vfo with a large
frequency span using less parts than a "regular" vfo? I really
don't understand why there isn't more information about these chips.
I have every QST, 73, CQ, Ham Radio magazine, handbooks etc since
1978. (I don't have any from the past year or so)Yet this is the
only article I ever came across that made it so simple with so few
parts. (every synth I have seen uses as least 10 ic!)

I called Motorola when this article first appeared and was told that
this chip will not be sold in the USA. I was hoping that by now it
may have made it's way over!

There are plenty of mixers where the IF frequency extends down to
DC. In those cases the IF port is not transformer coupled - the
transformers are on the RF and LO ports. These mixers are
also useful for phase detectors.

I don't beleive that this works in general. Generating a digital
signal with 'a high speed umpteen bit DAC', de-aliasing it
properly, and squaring it is _not_ the same as generating
the signal with a 1 bit DAC.

If you think about it, the anti-alias filter is needed to
interpolate between the two digital samples near the zero
crossing - without it the 1 bit DAC changes synchronously
with the clock frequency. The result contains significant
phase noise. I can probably steer you to an ap-note that
expounds if you are interested...

There is quite a FAQ about the GE Superadio. I saw it posted once
on rec.radio.shortwave. I just looked for it with yahoo, and you
can find the FAQ at:

GE Superadio FAQ General Information
http://www1.shore.net/~dmoisan/faqs/superradio/gesr_faq.

A simple search of FAQ's did not turn it up as a file somewhere, though
it might be non-html form elsewhere.

It's quite a nice FAQ; makes me want to get a Superradio.

It does have a section on adding SCA adaptors, but unless I didn't
look close enough, it does not give the details of adding it.

There were other sites that came up with Yahoo, so maybe doing
a better search, or using a different keyword, would turn up
the details you need.

Be sure to place a fuse between the filter capacitor and the crowbar! My Astron supply did not have the fuse. The pass transistor shorted. When the crowbar fired, shorting the LARGE filter capacitor, the crowbar simply opened allowing about 25 VDC to be sent on the the transceiver.

From past experiences, I found that there are many ISPs whose UUNET Newsgroup replenishment cycle is incomplete. If this is the case with your provider, tell them about the problem. If such a problem is not fixed in a week, I would strap on a parachute.

> About all I can agree with is that 2650 divided by 63.66 = 41.63 .
>
> Where do these numbers come from?

Has anyone ever pondered why Eimac does not specify a maximum grid current rating for the 8877 or any of the other tubes that are designed for Class AB2 g-g service?

The 8877 has an anode to grid C of 10pF. The 4kV/1A maximum ratings for the 8877 apply up to 250MHz. At 250MHz, 10 pF has 63.66 ohms of capacitive reactance. According to Eimac *CURVE 4250*, the 8877 begins to saturate at an anode to grid potential of about 250v. Therefore, with an anode supply voltage of 4000V, the peak AC anode voltage is about 4000v -250v = 3750v during the conduction half-cycle when the cathode is driven negative. The AC rms anode voltage = 1/2^0.5 *3750v = 0.7071*3750v = 2651V-rms. When 2651V-rms is applied to capacitor whose reactance is 63.66 ohms, the current is volts/ohms: 2651v/63.66 ohms = 41.63A-rms.

...Sure, 41A is an eyebrow-raising amount of grid current, but this is the case according to standard AC Circuit-Analysis, which applies in all parts of the universe, with the exception of one rather unique place in the State of Georgia. However, this place IS exceptional. For instance: the boiling point of gold is apparently lower there than elsewhere in the universe.

...snip...
>
> According to your numbers the grid dissipation is 2650^2/63.66 or 110
> kW. How can that be?

Jim: Is the dissipation in a capacitor equal to E^2/Reactance (ohms)---or is it I^2*ESR (ohms)?

With 96, paralleled, gold-plated flat grid-wires, the ESR of an 8877 grid must be extraordinarily low. The idea of less than 0.5A DC boiling the gold plating off a grid that Eimac designed to carry over 40A of AC---is about as believable as chipping golf balls on the front lawn at 10pm with the lights off. On second throught, maybe the defense should have argued that he was practicing for a night-time golf tournament. ..... However, I'll plead guilty to Monday-morning quarterbacking.

>me and none of the crystals are for frequencies that I use.

You can certainly not emulate the L,C, and R value of a crystal,
but if you figure out the oscillator diagram you can
find the same type of oscillator as RC circuit, amd implement it.

It might "sort of" work on receive, but it is bound to be completely
unusable on transmit. There are the following alternatives:

1) buy one set of crystals for the calling channel, and use the others as they
are,

2) move the the crystal oscillators by 50 to 100 KHz by adding capacitors or
coils

3) you can change the frequency of a crystal by removing it from it's
can and altering the slab somehow (adding or removing weight).

good luck, Moritz DL5UH

>feeds through to the output.

As described, this is in fact an absolute value circuit (full wave
rectifier). Overdrive the other mixer input to get a clean switching
waveform. As with ordinary full wave rectifiers, the output contains
the DC component and the 2f component and a lot of higher harmonics.
However, these are quite easy to filter out.

>fo the inputs meant for use as an oscillator, so that might get in
>the way of really good balance for this scheme.

If you operate the MC1496 in the linear mode as a 4 quadrant
multiplier and multiply two sine waves (at the same frequency), then
the output is the trigonometric relation sin(x)*sin(x) =
0.5*(1-cos(2x)), i.e. a DC component and the 2f component and nothing
else. However, an MC 1496 circuit published a few years ago, you could
only get a decent performance in the audio range and slightly above.
The performance was very sensitive to the input level.

Cannot find the article but in a older magazine there was a piece on
building a mixer for this purpose. The Heathkit SB620 has a port for
injecting a a signal in to use a different IF. Might be a bit of
work but quite a possible mode if your willing to deal with an
outboard mixer.

A very good reference is _Introduction to Radio Frequency Design_ by Wes
Hayward. In it, he shows an equivalent circuit for a crystal of a seriel
RLC, with shunt C across the whole lot. He gives typical values for the
series components for a 5 MHz crystal of L = 95 mH, C = 11 fF, and R = 30
ohms. Good luck!

>--
>--Rich-- ag6k, 805-386-3734

We apparetnly are dealing with an apples/oranges problem here.
Undoubtedly there is a small contribution to the grid dissipation from
the ESR of the grid. However, that is normally ignored because it is
small compared to the normal grid dissipation. Most of the heat being
generated by the reactive grid curent is in this newsgroup.

Grid dissipation arises not from the grid current flowing through the
equivalent series resistance of the grid, but from the energy of the
electrons stopped by the grid (grid interception). This grid current
is measurable as a direct current since the grid stops electrons, bur

normally doesn't emit them. The energy of the grid is determined by the grid voltage and is also a function of the time it takes the electrons to travel from the cathode to the grid (transit time factor). Ignoring the transit time factor the grid dissipation is related to teh integral of the voltage times the curent over the rf cycle. While this can be calculated from the tube characteristic curves, it cannot easily be measured.

Generally, we call the product of the dc grid voltage times the dc grid current the dissipation, it is only an estimate. As an example, I have a calculation for the grid dissipation of a YU-176 operating at 10 kW output. The grid bias voltage is -70 volts. The peak instantaneous grid voltage is +41 volts. The calculated grid dissipationis 11 W. But if I multiply the average grid current, which is what I measure with my grid current meter, times the bias voltage, I get 23 W which overestimates the grid dissipation by a factor of 2. The factor of 2 is not a rule of thumb, since it varies, depending on the operating conditions. However, I believe that the dc method always overestimates the actual grid dissipation.

What will really boil the gold of the grid is too many energetic electrons hitting it. One way for this to happen is for the plate tank to be too lightly loaded. Then the plate voltage swings to a low value and does not pull as many electrons through the grid and more electrons hit the grid. Another way is excess grid drive, which can arise from the external source or internally from self oscillation (parasitics).

A general rule of thumb is to operate the amplifier with heavy loading,sacrificing efficiency for lower grid dissipation.

I have had the same problem with my power supply and the crowbar was hid
in a tube filled with exopy, without a schematic and after about two sets
of pass xtrs I found the crowbar and chunked it for now. Be shure and fuse
before the crowbar.

> Why do you need to X-mit out of band anyway?

The marine band is in the 160+ MHz range, while 2m is in the 146MHz range. Unfortunately most transmitters can't over this wide of range unless they are specially built. Most ham transcievers aren't in this catagory (in fact I don't know of any that might be). To span this range you are talking about tuning over+10% in frequency. This isn't easy with high Q output stages.

I won't get into receive problems, but with 10.7 MHz IF's iimmaaggeess come to mind as being especially troublesome.

As always, your mileage will vary.

The cheaper solution is to buy another radio, IMHO.

A Yaesu FT-2500 will easily do this. The mod is in the Artsci books- you just cut a green wire. I've used this rig on the marine bands with no problem. Also have done the same with a Yaesu FT10 HT.

I recall an article in a magazine once where a crystal VHF receiver like this was built inside a Radio Shack mini amplified speaker (the one that looks like a transistor radio). The system was ideal for listening in while onboard an aircraft since there was nothing like an LO that would radiate.

Steve Muther

A crowbar is a circuit which goes across the power supply output, after the fuse. It is intended to monitor the output voltage and apply a short circuit (hence "crowbar") across the output if the output exceeds a predetermined value. This will then blow the fuse, isolating the $$$ equipment from the faulty pwr supply. Typically the circuit is a heavy duty SCR across the output with the gate connected to a control circuit. The control circuit can be as simple as a few resistors and a zener diode (poor response) to one using an ic like the LM311 comparator. I have seen commercial ("brick") modules as well. Check an SCR applications manual of possibly LM311 applications notes for more specific circuit details. Haven't looked, but I bet the ARRL Handbook has a circuit. _Woody_

Visit http://www.hamradio-online.com

License data, technological, demographic, political and economic change (such as spectrum auctions) demand a dramatic rethinking of all aspects of Amateur Radio as we find our place in the 21st century. Do not underestimate the challenges we face - if we continue down our present course, Amateur Radio may fade into the static of history. We present a wide ranging, no-holds barred set of critical questions to encourage you to understand the problem and then think through the solutions.

Did you know, for instance, that the FCC rules actually prohibit innovation in modern digital communications? Did you know that our own "voluntary" band plans stifle innovation and tend to create unused bands ripe for the picking by other radio services?

43% of all hams are now Technician class licenses who operate mostly at VHF/UHF. According to a W5YI report, in 1996, the combined total of General+Advanced+Extra class hams actually declined - yet our "incentive" licensing system has all of the incentives at HF - does this make any sense?

We ask a lot of tough questions and we'd like your opinion.

>here on 6 Feb.

The aticle referenced is not on my news server.

About all I can agree with is that 2650 divided by 63.66 = 41.63 .

Where do these numbers come from? I have before me Eimac typical constant current characteristics for the 3CX1500A7/8877 in grounded grid operation. The maximum instantaneous grid current displayed on these curves is 1.0 A. At an instantaneous grid-cathode voltage of +100 volts, the grid current is 1 A,, the plate-to-grid voltage is about 500 volts and the instantaneous peak plate current is 5.0 A.

According to your numbers the grid dissipation is 2650^2/63.66 or 110 kW. How can that be?

Where does the 2650 volts come from? The amplification factor of the tube is 200, not 1, which 2560 rms (3750 peak) suggests, The cathode area of that tube is around 10 cm^2. I have pulsed a 3 cm^2 cathode to about 25 A which was all I could get. Extrapolating this suggests you might get as much as 83 A total peak cathode current. And, half of that is going to the grid? Again, I do not understand.

The planar triodes I work with (YU-141 and YU-176) operate at about 1 to 1,5 A pulsed grid current with 4 to 5 A pulsed cathode current with 9 kV plate voltage and 100 v peak grid-cathode. The pulsed grid power is less than 200 W and the tube is putting out 20 to 30 kW pulsed. And these guys have a lot of grid interception, 25 % of the cathode current goes to the grid.

There is a pulse version, the 3CPX1500A7 that I have run with 7 kV on the plate and achieved 50 kW peak power output at 2 MHz. The grid-cathode voltage was pulsed to about +400 volts instantaneous peak with a power MOSFET switch in the cathode circuit. This corresponds to about 17 A instantaneous peak plate current, and the load impedance is about 360 ohms. The cathode impedance is about 20 ohms for these operating conditions.

I've been thinking about it and theoreticly it should be possible to build a tunable, plug-in L/C/R circuit to replace a radios crystals, that emulates a crystal in every way except frequency stability.

If this is correct, I'd like to find some info on it. I have an old crystal controlled 12 channel Standard 2-Meter mobile that someone gave me and none of the crystals are for frequencies that I use. Crystals cost about $13 plus tax each these days and I'll be darned if I am going to pay $366 plus S&H to recrystal an old 12 channel boat anchor!

1756. Directional Couplers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-13 00:00:00 UTC
From: mramos@originet.COM.BR
Message-ID: <199702131348.KAA01524@netra01.origin.com.br>
Source record: 97490

Hi all:

Some time ago I posted a msg. looking for some information about
RF pick-up using striplines. There was some answers but I lost
them in a HD crash.
Well, still dealing with this subject and:

-Is there any program (basic, spread-sheet, executable) to perform
such calculations?
-Where to find the "math." solution, say, formulas and some explanation?

I intend to make some samplers (directional couplers) to 902/1296/2304
MHz to SWR/Power measurements using G10 or Teflon PCB. And what
about broadbanding, using any - or none - core, more or less the same
approach used at HF/some VHF? And the detector diodes(HPs, zero-bias,
etc...)?
I allready have some literature, from ARRL Handbooks, magazines, Microwa-
ve Experimenter Handbook, etc. But most of them falls on HF aplications,
the only exception is some Directional Copuler to VHF that appears on
several ARRL Handbooks and Antenna Handbooks(already contructed and
still working).

Any comments?
Best Rergards.

The RF and LO ports are fed thru transformers.
The IF port also couples to the diodes via the secondaries of
the transformers, but not as a straightforward transformer
coupling. (Referring here to a conventional DBM).

>It's been a while, but I recall once having trouble with a DDS

This is a common misconception about DDS's. You really do
need those umpteen bits. If you use just the MSB, it will
have severe jitter, due to aliasing. See any tutorial paper
on DDS's for an explanation.

When I was young and foolish (and held a Novice license), I
built a "VFO" for my crystal controlled rig by plugging a tank
circuit into the crystal socket. It "worked", but the frequency
stability was predictably poor!

Nowadays, even a Novice can build a little synthesizer to plug
into the crystal socket and get good results. Maybe you should
try that.

> Okay, give me a tutorial on how I can construct custom ICs.

One of the easiest ways is to invest $99.00 in a PC-based software
package called "Warp" from Cypress semiconductor (not to be confused
with OS/2 Warp, the operating system from IBM) ... it's a complete design
system including VHDL compiler, simulation, etc. for all of Cypress's
programable logic and FPGA parts ... it even includes a very good
book to teach yourself the basics of VHDL (VHDL is a hardware description
language ... and IEEE standard ... which allows custom integrated circuits
to be designed in software, then "targeted" to any of a variety of
architectures
or processes from PALS to CPLDs to FPGAs to full-custom ASICs ...)

Numerous other vendors of PLDs, CPLDs, and FPGAs (Lattice, Phillips,
Altera,
Atmel, Xilinx, et al) will happily send you a free CDROM with their
"starter set"
of development tools ... many are based on the Scenario system from Data
I/O ...

I can support/target designs to about 8 vendors' architectures and
processes.

Further instruction is beyond the scope of this post, but if you're really
interested
in designing your own ASICs, it *IS* within your reach ... or the reach of
anyone
who truly wants to ... you can even get full-custom parts processed
through a
special foundry service called MOSIS for a few thousand dollars (for a
modest run
of prototype parts) if your design is not amenable to implementation in
CPLDs or
FPGAs.

>
> >Correction #3 ... the vast majority of parts are not custom, but rather

> available.

Any radio from the 80s is far enough behind the times that it's likely not worth
repairing, even if the parts are easy to find ... toss it and build/buy something
more up-to-date ... maybe even something more advanced than a beeper.

>
> >Correction #4 ... even if there is a truly custom IC, you can order the
> >part
> >and replace it yourself a lot faster than sending the rig in for repair
>
> "Supplies are exhausted" was the response from the factory.
>

It's hard to find most tubes any more too ... they've been obsoleted by
better things. Learn to live with progress and move forward, instead of
clinging to the past.

Hell, I have a 486-25 computer (no-name notebook) that I can't find parts
for either ... I'll end up scavenging what I can from it to build something

else, but it'll never live as a notebook again ...

Jeffrey Herman (jeffreyh@Hawaii.Edu) wrote:

: I picked up a couple 567 ICs and want to use one for a 1050 Hz tone
: decoder (that's the National Weather Service's alert tone). The
: decoder circuit I've come across is as follows:
: +--------------------------------------+
[snip]
: 500-1k Resistor: 1K for 3.5 mA, 500 ohms for more (no more than 100 mA)
: R: 20-25K
: C: .022 uF
: Center freq = f = 1.1 / RC
: Bandwidth < 14% of f

: So the bandwidth should be less than 140 Hz at 1050 Hz.
: Is this the standard circuit for the 567 or does someone have one
: that will provide less bandwidth? How stable can I expect the decoder
: to be?

The biggest problem is the thermal characterists of the
capacitor. C=.022uf is probably more like c=.022 +/-20% +/-.002/degF
If you use a variable resistor, you also need to worry about
the thermal characteristics of that resistor.

If your radio is "stock", it only recievs on bands other than AMATEURE. So whats the problem??? If it is a modified version that transmits out of band, chances are one of (I can't remember right off hand which) the chip diodes have been removed. Unless you have a very intricate solder station, restoration of the diode will require factory re-installation. If you want more info on which diode...contact me thru the newsgroup. 73/Mike

What do you mean you don't know of any radios tha can go from 2m to
the marine band??? Most of the new Kenwood HTs can, such as the
th-22, th078, and for that matter the alinco 2m ht's can just by
snipping a wire.

Look people. I asked for help! I would like to modify a ham rig for
use on the marine band for emergency use so I don't have to waste a

bunch of money on a MARINE rig I'll never use. I am sick and tired of all the unsolicited e-mails from cranky old men who have nothing better to do than to tell me this is illegal (which it is not).

If you cannot offer me the help I ask for but would rather treat me like an unintelligent fool than KEEP YOUR FUCKING MOUTHS SHUT.

Oh...I guess I'll get hate mail for that...

Whatever...I give up on getting help from ham operators...you are all a bunch of turn-of-the-century jack-asses who cannot handle progress and new technology.

From on generation X-er, I can't wait 'till you all die.

1769. GIF, JPEG scanning service. FREE OFFER! A picture is worth a thousand words! (bnFEpJ)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-14 00:00:00 UTC
From: scanning@XXX1324noreply.com
Message-ID: <e75eRHhG8GA.219@uptgmsnb01>
Source record: 97320

Why don't you print or save this info in case you need it in the future?

Hello Friends,
It's time to take full advantage of the online medium by having your photographs scanned today! Once your pictures are scanned into one of three formats (GIF, JPEG, or BMP) you can do many exciting things with them.

-You'll easily be able to attach them to emails and send them to people your chatting with online. No more having to try and explain what you look like!

-You can also use your photos in all kinds of fun projects: build web pages; design your own greeting cards; make personalized stationary,desktops, and screen savers- the list is endless!

- Scan pictures of yourself, your pet, your vacation, or whatever you choose!

Cyber Services will scan ANY photograph, drawing, magazine clipping, or other artwork to an image file, and email or US mail it (on disk) back to you within 24 hours of its receipt. (You must be able to receive file attachments to get your file(s) via email. Check with your ISP if your not sure.) PRIVACY & CONFIDENTIALITY ARE ASSURED. You'll also receive helpful technical tips on everything from renaming your file to saving time when sending it to people via email.

We scan all our images in 16.7 million colors for best quality. For just $1 extra we can enlarge or crop your photo, blur out a body part, or ad text (such as your name or email address).

Best of all, as a FREE GIFT to you (limited time only), IF YOU CHOOSE TO, we'll reserve you a FREE PAGE (or pages) in our "Internet Date-Site" (Now under construction!!!). This web site contains pages classified by local area and sexual preference. There's also a erotic image gallery (must be legal age to enter), and a "special interests" section. That's right, you can have your own page on the internet for just $4! (Note: You're responsible for answering your dog's email!) Your free page(s) will include any or all of the following: Your scanned photo(s) (You pick which ones- You can have some, none or all of your photos posted on your page), your email address with an icon visitors can click to send you mail, and a brief profile about you. We'll remove or modify your page, at your request, at anytime! When the "Date-Site" opens for business, you'll receive an email notifying you of the address of your personal web page. You can give the address to people and they can view it from any internet
connection! There are millions and millions of people on the internet.It's

time you start meeting them! (This service won't be free for long so act now!)

If you have any questions regarding our services, please call us at (541)744-5718.

Ordering Information:

Price: $4 for first scan, $3 for each additional scan
Extras: $1 each to add personalized information. (name/email)
$1 each to have image modified (enlarged, body part blurred, etc..)
$2 to have image files mailed to you on a floppy disk (IBM or MAC).
$1 credit card processing fee (Visa/Mastercard users only)

If you would like your photographs returned to you please include a self addressed stamped envelope. Otherwise they will be destroyed.

Order Form (PRINT OUT or COPY CLEARLY):

Name (optional):

Email Address or Screen name (PRINT CLEARLY! You must be able to receive file attachments. Otherwise include $2 for shipment on floppy disk.):

Address (optional unless having shipped on disk):

Phone number (optional):

File type (GIF, JPEG, or BMP. GIF recommended):

Extras (Exact personalized info you want printed on scan):

Disk Format (if having mailed on a floppy): IBM or MAC

Payment method (Cash, Check, Money Order, or Visa/Mastercard):
Please make checks payable to Cyber Services.

Credit Card # (credit card orders only):

Expiration date:
Don't forget to include the $1 processing fee if your paying with your credit card.

Do you want the FREE GIFT? Yes or No (circle one)
-Web Page(s) in our "Internet Date-Site" (under construction). You can have a page for yourself, a page for your car, and a page for your cat! Be sure to indicate where you want your page (F4M, M4F, F4F, F4M, or Couples) and which of the following info you want on your page (print clearly): State and Town, email address, year or birth, physical description, quote/message (under 30 words please). Please indicate which photos you want on your page (if any) if you don't want them all to be displayed. If your want your nude/erotic photos displayed in our erotic image gallery YOU MUST include a signed statement that your are over 18 years of age or older and give us

consent to display your nude/erotic photo, and be sure to tell us if your want it displayed with your info or anonymously.

Mail the above information and photos with payment to:

Cyber Services
2852 Willamette St. #131
Department 1
Eugene, OR 97405

Orders sent overnight will be given first priority.

Erotic/Nude photo's will be accepted providing everyone in them is of legal age.

Questions? Call (541)744-5718

Please help our small business grow by sharing this info with someone you think could use it.

Thank You!

(bnFEpJ)

Interesting dissertation, Jim. Is the grid effected by electrons that
bounce off the anode?

I have a recently-opened 8877 that failed in an HF amplifier. With 30x
magnification, I see areas of pooled gold on the grid wires. I see areas
where gold has apparently pooled and evaporated--baring the gray tungsten
(?) base-metal. The gold pools and evaporated areas are in the lower 30%
of the grid--i.e., the end of the grid that is nearest the (grounded)
grid-collet. In the top 70% of the grid, I see no pooled gold or areas
where gold evaporated. This damage pattern is similar to what I saw on the
grid of the 8877 that is shown in Figure 4 on page 16 in the September 1990
issue of *QST* magazine. I have seen this pattern before in other kaput
8877s that failed in HF service. However, IMO, such a damage pattern is
not consistent with HF current distribution.
I have one unopened, kaput 8877 that has loose gold according to the
Funderburg Test. If I get around to removing the anode, I will report the
results here.

An update from Rick, KC0UH:

Sent: 2/12/1997 8:37 AM
Received: 2/12/1997 10:23 AM
From: KC0HH, rjmay@iguana.ruralnet.net
To: Rich Measures, measures@vc.net

Hi Rich,

Tha AL-80A is working fine. I have not experienced any "snap crackles or pops" from the amp at all. The one thing I do notice is that it seems to tune smoother. I talked to Ray (NE1Y) yesterday and he said he noticed the same effect in his TL-922A after installing the suppressors.

See Ya

Rick
--

Rick May - KC0HH

Note: Rick uses the AL-80A exclusively on 80M to drive the same Delta Loop he was using when bandswitches #1 and #2 apparently arced and some contacts evaporated. Rick is currently using bandswitch #3. Photographs of bandswitches #1 and #2 can be found at Figure 15 on my Web site:

...snip...

Is it likely that 100 watts of drive could evaporate gold from an 8877 grid? Each of the 96 gold-plated rectangular grid wires is 0.85 inches in length. Even if half of the drive power could be directed into the grid, that works out to 0.52 watts per grid wire. Does this seem likely to be enough energy to melt gold?

Maximum tank voltage and maximum grid current occur only at tank resonance. If the tank is resonant on a band other than the drive frequency, tank voltage and grid current would seemingly be minimal, Phil. I tried switching a SB-220 and a TL-922 to the wrong band. The amount of cathode drive was minimal in either case because: 1. the TS-440S throttles back due to high SWR, and 2. the tuned input circuit effectively blocks energy for other bands. The bottom line is that there wasn't much of anything going on when I selected the wrong bandswitch position and drove each amplifier.

Phil: does your 70mA grid-trip circuit trip when the bandswitch is set to the wrong band and the amplifier is driven?

The supply voltage to the circuit can also be a serious stability
problem. The data sheets show (and experience proves) that the most
stable operation is obtained at a supply voltage of 5.6-6.0 volts.
Regulate the supply to somewhere in that range if possible.

1776. Silver Plated Strap

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-14 00:00:00 UTC
From: Russ Ellsworth <russcwv@cyberhighway.net>
Message-ID: <330474D3.E64@cyberhighway.net>
Source record: 97327

I am in the process of building a HF Amp and need to find some copper strap, hopefully silver plated for tank circuit connections. The silver plating is more for looks than efficiency at HF but it would fit better with the other components than plain copper. Any ideas??
Thanks, Russ Ellsworth..WA6CWV, Boise Idaho

That is certainly possible. Such an effect would have to occur at high enough frequencies that the anode-grid potential reverses before the electrons get to the anode. The time it takes the electrons to traverse the tube is called the transit time. This is what generally limits the upper frequency of operation since the efficiency falls off rapidly when the transit time is a significant fraction of an rf cycle. There are other frequency limiting factors such as the inductance of the internal connections and the length of the electrodes (in cylindrical electrode tubes.)

The discussion above is limited to triodes. Secondary emiission from the anode is a problem with tetrodes, especially when the instantaneous anode voltage drops below the screen voltage. The suppressor grid was invented to help this proablem. Personally, for UHF in particular, I like triodes for their simplicity.

>not consistent with HF current distribution.

Two things could cause a distribution of heat damage as you describe it. One is that there was more dissipation in the damage area. The other is that the cooling was better in the undamaged area. The available cooling mechanisms are conduction and radiation. The bottom end is the only part with conduction cooling, through the grid support struccture. Radiation cooling would be to the anode. The distribution would depend on the distribution of temperature on the anode, and other factors, such as the emissivity of the anode and grid as a function of position. The end might be different from the sides, for example.

However, I don't see an obvious big difference in the grid cooling from one end to the other, except for conduction through the support structure which would add cooling to the bottom end (unless, through some perverse circumstances it was the source of heat.)

The upshot of all this is that a distribution of dissipation is a good possible explanation for more damage at the low end of the tube. Any open circuited rf structure will have a high impedance at the open end. The voltage will fall off as the cosine of the electrical distance from the open end and the current will increase as the sine of the electrical distance (fraction of wavelength, measured in degrees.) If the wavelength is comparable to the structure length, a current maxima would occur within the structure at the quarter wave point.

If standing waves are the source of the heating, they would obviously be from some unwanted source, i.e. parasitic oscillations. I don't know how long the grid structure is, but if you assume that it is a quarter-wave long, you can estimate the frequency of the standing wave. 2" is a quarter wavelength at 1bout 1500 MHz and 3" for 1000 MHz. Of course heat damage could occur before the quarter wave point so this sets an upper limit on the frequency. It could perhaps be half of that.

These are pretty high frequencies, but not impossible. However the upper frequency limit of the tube has been stated as 250 MHz. If the transit time factor is coming into play at 250 MHz, the gan of the tube will be pretty well shot at 500 MHz.

This is not inconsistent with what is observed becasue it is difficult to pin the frequency down that closely with a lot of arm-waving arguments.

If the frequency of a parasitic is on the order of 500 MHz, all discussions of resonant impedances and relative effectiveness of parasitic suppressors are arm-waving as well. Without knowing the voltage and current distribution in the spurious resonant circuits, which are affected by the parasitic suppressor itself, any attempt to de-Q the parasitic resonance so oscillations don't occur, is cut-and-try at best.

The answer is probably to build a frequency synthesiser to supply the
frequency instead of the crystal careful design required for the vco.

The synthetic crystal approach is not so daft!
The crystal is represented as an L+C +r in series with a C shunting the
lot.
You cant achieve the values the crystal gives but you can achieve the
same resonant frequency and R. You wont get crystal like stability
either but you should be able to repeat to a few ppm/second with careful
design. If you can put up with the size I would propose a helical
resonator with some dust iron in the core to increase inductance reduce
size. Basically you need to minimise coupling to the LC to reduce
circuit pulling.

Hi Rich,

Before you go off into Oz with the gold again, can you answer this question?

In article <measures-ya02408000R0402970132530001@news.vcnet.com>,
measures@mail.vcnet.com (R. L. Measures) writes:

>In other words, the arcing that destroyed the original bandswitch and
>the replacement bandswitch in Rick May's AL-80 can not be explained by a
load
>fault. The only thing that was altered after bandswitch #3 was the
>VHF-Rp of the VHF suppressor in the AL-80.

Measure then claims....

>The original suppressor has an Rp of
>about 166 ohms at the anode resonant frequency of 160MHz.

That's the stock suppressor, 166 ohms (by the way 160 MHz is NOT the
frequency an AL-80 oscillates at if the suppresor is removed).

>The replacement suppressor has an Rp that is around 101 ohms at 160MHz.

That's his nichrome suppressor, 101 ohms.

>Since voltage gain is essentially Mu*Rp, decreasing VHF-Rp decreases VHF
voltage gain.

Rich is very plainly claiming LOWERING parallel (Rp he calls it)
resistance of the
suppressor will decrease VHF gain and increase VHF stability. He cites
that as
proof damage was from a parasitic.

We can deduce the following:

1.) If a lower Rp suppressor (such as in the suppressor Measures touts)
results in more system stability, the ultimate reduction in Rp will occur
with a dead short for a suppressor.

2.) If Measures is correct in his claims, the highest Rp would result from
an open anode lead, or a very high resistance in series with the anode
lead.

According to Measure's theory, if we connect a 5000 ohm resistor in series
with the anode it would make the PA less stable than with a zero ohm
series resistor. From that we can conclude removing suppressors from
equipment and replacing them with shorts will result in maximum VHF gain
reduction and maximum stability.

We all know this is untrue. The reason why the higher resistance value of Rp increases stability is because it is part of a larger system that has a finite impedance larger than zero ohms.

The only case where his suppressor would help is if the impedance of the anode path is very low, and the original suppressor has an even lower Rp than his suppressor. In the case of the AL-80, Rich's suppressor actually decreased stability....you can bet on it.

There is absolutely no technical reason for using nichrome, since even the slightest adjustment in inductance and resistance in a convetional suppressor will produce much more predictable results. The correct way to go is to increase the parallel impedance and resistance of the suppressor, not decrease it, if we need more stability.

Don't confuse the excellent front end filtering of the HTX202
with the mediocre filtering of the HTX212. The latter *will* receive
out of band, and suffers the intermod which commonly accompanies
such a "feature" (I'm tempted to say "such a defect"). It will
also transmit out of band (MARS/CAP enabled), but not very far
out of band. The firmware won't let it operate on Marine channels
(where it would be illegal to use anyway since it isn't Type
Accepted for that service).

I'd like to add that it is important for amateurs to fight against
this sort of misuse of amateur equipment by people operating in
other services. We should all recall the uncomfortable restrictions
placed on amateur amplifiers due to misuse by members of the CB service.
We are likely to see similarly uncomfortable restrictions placed on
amateur VHF/UHF equipment if it continues to be misused by operators
in other services such as the public safety, land mobile, or marine
services.

>decoder (that's the National Weather Service's alert tone).

Jeff, you should be aware that the long tone alerting system will be phased out shortly. As of July 1 1997, the new digital EAS alerting system will be mandatory (it is already in place voluntarily starting Jan 1 1997). This uses a short digital data burst to activate alert receivers (it also transmits the text of alert messages to receivers equipped to decode it). Thus the old long alerting tones will soon be history.

[diagram snipped]
>So the bandwidth should be less than 140 Hz at 1050 Hz.
>Is this the standard circuit for the 567 or does someone have one
>that will provide less bandwidth? How stable can I expect the decoder
>to be?

This isn't a very stable circuit, but if coupled to a one-shot qualifier to eliminate falsing on short snatches of 1050 Hz, it will suffice for the old tone alert system (a real alert tone has a duration of 8 seconds, anything shorter is a false alarm). But you really need to build the new EAS decoder instead. That can be embedded in a single chip microcontroller. One of the cheap little PIC processors will do.

Hi Rich--

Glad to hear Rick May's amplifier tunes more smoothly. Could that be because the Q of the pi-network in his AL-80 has been compromised at HF by installing your product--reducing its harmonic surpression? Do you own a spectrum analyzer? Also, have you ever tested your line of aftermarket chokes for this effect using a spectrum analyzer? If so, can you provide credible data toward that end?

I think the point Mark is trying to make is that since he pays a fee to use the Internet, and almost everything one could possibly want to find is there- that it's all available for the fee he's already paying- it only makes sense to rationalize that somewhere on the Internet- there's a schematic (with accompanying diagrams for the construction thereof) for anything that anyone would wish to build. (Whew!-) So- why should he pay for a book or magazine when he can get it for "free"? Can you blame him?

Excellent treatise! I learned a lot from reading that...

On the off chance that Joel was asking something of a different meaning, I offer an explanation from a different perspective:

There are FUNDAMENTAL oscillators and MIXED oscillators. In a fundamental circuit, the circuit operates at the same frequency as the crystal. In a mixed circuit (more than one crystal to get a "mixed" frequency), there exists the fundamental frequency of each crystal, the SUM of the two crystal, and the DIFFERENCE between the two crystals. They're usually used at the frequency of either the sum or difference, and the offending "other" frequencies are filtered away.

i.e. an 8MHz crystal and a 10MHz crystal would produce, for example, both 18MHz and 2MHz. (the subject is much more complex than that, but this is merely an example...) 73, Web Williams- KR4WM

...snip...

While it is true that no net displacement of electrons flows through a capacitor, nevertheless, an equal and opposite displacement of electrons flows back and forth that produces an I^2*ESR loss in real watts. Some people call AC an apparent current.

The next time you receive your monthly electric bill, Gary, try arguing that, since no real current---i.e., no net displacement of electrons---flowed through your residence, you could not possibly have consumed any electric power whatsoever.

>The full mesh also includes the plate tank circuit, and that's
>about 5000 ohms, ...snip...

The output Z of an amplifier tube in linear service is approximately equal to the anode supply voltage divided by two times the avg. anode current. For an 8877 at full-tilt, that would be 4000v/(2*1a)=2000 ohms. 5000 ohms does not win the teddy bear, Gary---however, you may choose between a

6-ounce bottle of "Babe" shampoo or a 5lb. bag of Bandini.

I stand by my answer of 41.63A-rms.

Let's give this stuff the once over.

Measures wrote:

>Has anyone ever pondered why Eimac does not specify a maximum grid
>current rating for the 8877 or any of the other tubes that are designed for
>Class AB2 g-g service?

The real reason is because grid heating is primarily due to kinetic energy heating of the grid. Virtually none of it is related to I squared R losses in the conductor. Only I squared R heating or current limited by emission could have a current rating. This has been mentioned dozens of times.

>The 8877 has an anode to grid C of 10pF.

In grid driven service, but that figure includes all the capacitances. Those capacitances include those from the anode cooler to the tube's grid ring, internal grid support cone, grid support wires, and so on as determined in a special test fixture.

The actual capacitance to the grid wires is much less than ten pF.

Eimac's data sheet 2206 (3/91) lists Cgp in grounded grid at .1 pF. I have some question if it is really that low in practice, but certainly a figure of ten pF is far from correct for the capacitance of the anode to the grid wires themselves.

Figures in the data are mainly to insure tube interchange ability, are NOT to be used in calculating internal performance of the tube.

>The 4kV/1A maximum ratings for the 8877 apply up to 250MHz. At
>250MHz, 10 pF has 63.66 ohms of capacitive reactance. According to

OK there.

>When 2651V-rms is applied to capacitor whose reactance is 63.66
>ohms, the current is volts/ohms: 2651v/63.66 ohms = 41.63A-rms.

Eimac says 0.1 pF for Cgp, in grounded grid. That's 6366 ohms or .416 amperes. The data I have seen indicates Cgp of .1 pF and a OUTPUT capacitance of ten pF.

I am not qualified to say how much current is induced in the grid from capacitance, and how that current is distributed in the grid. Neither is Richard Measures. The truth is neither of us have any idea how much capacitance there is from the grid wires themselves to the anode INSIDE the tube, nor do we have any idea what the ESR or current distribution would be. So all your data, and any arguements about it, are a waste of everyone's time.

>Sure, 41A is an eyebrow-raising amount of grid current, but this is the
>case according to standard AC Circuit-Analysis, which applies in all parts
>of the universe, with the exception of one rather unique place in the State
>of Georgia.

Garbage in to the calculation, garbage out. That's the rule here.

>However, this place IS exceptional. For instance: the
>boiling point of gold is apparently lower there than elsewhere in the
>universe.

Indeed, your place is exceptional. In your place, the grid is heated by I squared R heating. Using your theories, the anode would take hundreds or thousands of amperes before heating to the point of damage.

Rich if you are correct, why is anode dissipation plate current times plate voltage in a dc state? Why is grid dissipation the same? Why for RF, is dissipation the integrated value of element current and voltage to the electron source (usually the cathode) over the time period the element is conducting current?

Your argument is beyond silly Richard. Even a mildly competent designer knows anode dissipation is I times E and the resistance of the conductor is unimportant in the calculation.

>With 96, paralleled, gold-plated flat grid-wires, the ESR of an 8877 grid
>must be extraordinarily low. The idea of less than 0.5A DC boiling the
>gold plating off a grid that Eimac designed to carry over 40A of AC---is
>about as believable as chipping golf balls on the front lawn at 10pm with
<snip>

Richard, how much current will the filament carry? How much current will the anode support? Do you really believe Eimac designed the grid to carry 40 amperes, or are you just pulling our legs?

Rich, put money where your mouth is. If I run 10 amperes of dc into a 8877 grid, will you agree to pay for every tube whose grid burns out? I'll run ONE ampere dc into a 8877 grid. Will you agree to pay for every 8877 that evaporates, flakes or sputters the gold grid plating off the grid?

Richard, you have to be doing this on purpose just to keep an argument going. Certainly you are not this stupid. You must know full and well the primary heating mechanism is the kinetic energy of the electrons bombarding the grid and anode, because any beginner generally knows that. To calculate anode

dissipation, it is simply I times E integrated over the period when the anode is conducting. Grid dissipation is calculated exactly the same way.

If this was not the case, Eimac WOULD give current limits for the grid. As it is, the grid dissipation must be calculated from grid to cathode voltage times current integrated over the conducting portion of the RF grid current cycle.

Output capacitance includes all the capacitances in parallel, and most of this capacitance is NOT to the grid wires themselves. Not only that, you certainly are smart enough to understand the entire amount of grid terminal current can not possibly flow over the entire length of the grid structure.

Are you mixing models and data to confuse other people, or are you really confused by tubes, circuits, and PA's? Is this intentional game playing, or is it something pathological you can't control?

(this is a copy of my response on this subject to jeffreyH, Busybody)
Well, aren't we self-righteous today! In any event, as it happens I do own a marine radio. It is not portable, and is attached to my large boat. Therefore, it is not suitable for use in a small boat of the sort I rented on my last vacation. The FT-11 was much more appropriate, and, when the engine conked out in my rental boat in the middle of Puget Sound, I was able to call for help! So sorry I didn't use a "type approved" radio- I suppose it would have been much better for my family and I to row the ten nautical miles or so to the coast. In addition, Jeffrey, you really don't have the slightest idea what you are talking about with respect to performance- I have a fully equipped radio communications shop including a Service Monitor and both a HP and Advantest spectrun analyzer and shielded room. I've looked at both of the radios with respect to deviation, spurs, and frequency stability- they are fully the equal of my Midland marine radio. In fact many of the ham rigs are based on commercial designs or vice versa- for example the IC02 and the essentially identical Aircraft HT's.
So go mind your own business Jeffrey.

I think it's the times, rather than a ban.

Years ago, when IC's first made digital synthesizers practical and inexpensive for the home builder, and the growth of 2M FM provided a need for a stable crystal replacement, the ham magazines were full of PLL synthesizer articles. Many of them were made with discrete TTL, though as time went on, higher scale integration did start fitting into the articles.

But by the time greatly integrated synthesizer IC's started to become greatly available, the need for building synthesizers for 2M rigs disappeared because most rigs were by then synthesized.

You can see a similar thing in the lack of 2M transmitter or receiver circuits being published. Year's ago, they were all over the place; if you went by the magazine articles today, nobody is building them. That might be true, but of course it brings up the question of which comes first? The lack of articles or the lack of building?

There never was a lot of interest in building HF synthesizers. Probably because LC oscillators were stable enough at that frequency range, and because it's so much harder to build a synthesizer with small channel spacing. You have to have a good loop filter, and you have to have some means of tuning it (BCD switches worked fine on 2M, but you want and need a tuning knob for HF use) and unless you can get really fine steps, you'll keep having odd sounding SSB.

Again, there isn't the "need" that occurred with 2M, since it's been a really long time since there weren't commercially available amateur transmitters/receivers/tranceivers that weren't VFO-tuned, and synthesizers were in the commercial rigs before they had really been explored in the homebrew arena.

SO there isn't a wealth of amateur-level information about HF synthesizers out there, which leads to low interest in building such things.

At least, with DDS there have been some articles published in the ham magazines. Presumably because it is a very new thing, so it has interested some in trying them out. With time, they too may "get lost" just as 2M rigs and 2M synthesizer construction articles have been lost.

Hmmmmm, I checked my copy of the _Heathkit Electronics Learning Dictionary_ and all my Graf books... No mention of this vocabulary. I cannot find any mention of it anywhere.... Hmmm. May I however suggest that one might substitute many of the phrases and words from _Ye Olde Farmers Booke of Epithets and Sulphurous Statements_ by Maledictus MacRanter. I am especially fond of "May all your rich neighbors sheep take their ease in your beard, Ye great lover of blended whiskey!"

I have found this phrase to be especially useful in the case of cold solder joints..

Hope this helps!

Source record: 97198

http://www.mtechnologies.com/mthome for ham software, kits, the CQC homepage, and more!

I've come by a supply of disposable anti-static wrist straps, which are a great (and safe) way to make sure that you are grounded when working with static-sensitive devices such as CMOS integrated circuits. Sure, you can run a clip lead from your wrist-watch or ear lobe to a convenient ground, and that will take care of static. But it will also route any high-current electricity that you happen to come in contact with, and is a bit like working with your bare feet on a wet floor. The SAFE way to do it, as with these straps, is to incorporate a current-limiting resistance so that static will be grounded off without an increased risk of electrocution.

While I've started including one at no charge with the Island Keyer kits, I've got more than I really know what to do with. So here's the deal--

Send me One Dollar ($1.00) and an SASE with 55 cents postage on it and I will send you FOUR wrist straps.

I'll also include some product literature since it won't increase the postage cost. Or if you are ordering something from Milestone Technologies via the web site (url below) or by phone just mention this to get any number of wrist straps at 4/$1 with no additional postage cost.

By the way, these are genuine 3M 2209's in original sealed packaging, and they are UL certified. They include the wrist strap, paper lead with embedded conductor and resistance, and copper foil tape to attach to a convenient ground.

Send your dollar and an SASE with 55 cents postage to:

Milestone Technologies
3140 S. Peoria St. Unit K-156
Aurora CO 80014-3155

PLEASE if you need more info e-mail me direct at aa0xi@mtechnologies.com rather than take up bandwidth in the newsgroup!

:>250MHz, the RF grid current is 2650v-rms/ 63.66 ohms = 41.63 amperes
:>rms.

Since the maximum rating of the 8877 grid is 25 Watts, you have to
be kidding about 40+ Amps of grid current. The grid structure
certainly has an resistance greater than 16 milli-Ohms (25/40^2).

Considering that grid current flows for a very short time, the
actual peak current is even higher ... If heating didn't kill grids
at 40 A the grid leads would certainly fuse.

The maximum PLATE rating is 1.0 Amp ... do you expect us to believe
the grid current is 40 TIMES the place current?

Sounds like more pathalogical science ...

From: Ted <Ted@cyberus.ca>
Message-ID: <5e3c4n$aub@cybernews.cyberus.ca>
Source record: 97248

Hi,

I want to increase the gain of a small loop antenna
for 217 Mhz.I got to deal with an omnidirectional antenna to
be sure picking up every low power (1-2dBm) transmitter from
100 feet area.
Any idea will be welcome.Do I need to switch to some other type
of antenna ? (whip,beateregg,turnstill, etc ...)
Also, I'm looking for a very low noise RF amplifier for 217 Mhz.
The receiver is suposed to work indoor ... a nasty problem from
begining. I cannot increase the sensitivity of the receiver below
-95dBm with a small loop, and an RF (18dB) Front End Filter.

Thanks in advance !
Ted

>example.

This is what Eimac gives as the main reason heat damage occurs
in one area. It is virtually impossible to ensure equal grid current
over the entire grid area when the tube is overdriven.

In normal operation, the grid wires remain outside the banded areas
of cathode. Grid interception of electrons is low, and since electron
bombardment is the primary heating mechanism ithe grid runs cool.

If the tube is overdriven, some areas of the grid attract electrons
much quicker than others and get hotter faster.

I think Rich argues against himself in his example about grid
currents of 41 amperes. He ignores several things (as usual) in his
theory.

He ignores the fact that MOST of the capacitance is outside the grid area
and really between the cooler (anode) and tube internals like the grid
support. Most important he falsely concludes the capacitance directly
relates to the anode voltage in calculating some sort of RMS current
that signifcantly heats in the grid.

Besides that, heating is a function of time and electron bombardment,
By the time the parasitic reached levels and duration times to cook the
grid, the current it would plainly show on the grid and plate meters.

The whole parasitic theory Rich offers is far beyond rational science
and never has been supported by anyone else in the industry, including
the tube manufacturer. To justify his wild claims, Rich stated the 25 watt
grid of an 8877 would dissipate 500 watts or more when driven with
HF RF. I have no idea where his latest voo doo about 41 ampere currents
in the grid is supposed to take us, but it won't be down the path of science.

Rich, if your suppressors work as you claim by having a low Rp value, the lowest Rp value is a short. Are you suggesting we remove suppressors and replace them with one-size-fits-all shorts?

Used Test Equipment Shipping free in continental USA:

(1) Power Mate BPA-40G, regulated power supply, 0 to 40 volts,
12 amps.Checked, working, but may need calibration and minor
repairs. $150.00

(1) Power mate BPG-40G, same as above,but not checked,
line cord cut,fuse and fuse holder cap missing,otherwise
looks clean. Offered "as is" for $50.00

(1) HP 628A, Signal generator, 15 to 21 Ghz, checked, working,
but may need calibration and minor repairs, $75.00

(1)BIRD 72-2 COAXIAL SWITCH,MANUAL,2 circuit,2 position,
850 W @ 100 MHz, N (f) $50.00

(2)HP G281A,WAVEGUIDE TO COAX ADAPTER,3.95 to 5.85 GHz,
UG-149A to N (f), $7.50 each

(4)HP J281A,WAVEGUIDE TO COAX ADAPTER,5.85 to 8.2 Ghz,
UG-344 to N (f), $7.50 each

(1)HP J370C,WAVEGUIDE FIXED ATTENUATOR,10 DB,5.85 to 8.2 GHz,
WR-137,UG-344, $10.00

(1)HP X375A,WAVEGUIDE ATTENUATOR,VARIABLE,8.2 to 12.4 Ghz,
0 to 25 DB,UG-39, $40.00

(1)HP G382A,WAVEGUIDE ATTENUATOR,VARIABLE,3.95 to 5.85 GHz,
0 to 50 DB,UG-149A, $50.00

(2)HP H382A,WAVEGUIDE ATTENUATOR,VARIABLE,7.5 to 10 GHz,
0 to 50 DB,UG-51, $40.00 each

(2)HP J382A,WAVEGUIDE ATTENUATOR,VARIABLE,5.85 to 8.2 GHz,
0 to 50 DB,UG-344, $40.00 each

(2)HP J424A, CRYSTAL DETECTOR MOUNT,UG344/BNC f,
$15.00 each

(1)HP J487B, THERMISTOR MOUNT, 5.85 to 8.2 GHz,
UG-344 / BNC (f), $15.00

(1)HP R752A,WAVEGUICE DIRECTIONAL COUPLER,10 DB,
26.5 to 40 GHz, missing termination, $25.00

(5)HP X752A,WAVEGUIDE DIRECTIONAL COUPLER,3 DB,
8.2 to 12.4 GHz, WR-90,UG-39, $10.00 each

(1)HP G914A,WAVEGUIDE TUNABLE LOAD,3.95 to 5.85 GHz,
WR-187,UG-149A, $10.00

(1)HP J920A,WAVEGUIDE MOVING SHORT,7.5 to 10 GHz,
knob tuned,UG-51, $10.00

(1)HP 8436A, BANDPASS FILTER, 8 TO 12.4 GHz,
N(m)to N(f),$50.00

(3)HP 11523A,LOAD RESISTOR, feedthrough termination for
HP 420 series detectors, $5.00 each

(3)JFW 50F-006, COAXIAL ATTENUATOR, 6 dB, DC to 2 GHz,
TNC connect, new never used, $10.00 each

(2)NARDA 47G2,WAVEGUIDE ATTENUATOR,
VARIABLE 0 to 40 dB, $25.00 each

(2)NARDA 4773-20 SMA COAXIAL ATTENUATOR, 20 dB,
DC to 6 GHz, $20.00 each

(4)NORSAL 12104 MIXER, SMA CONNECTORS,
NEW NEVER USED, $15.00 each

(1)WAVELINE 60562,WAVEGUIDE ATTENUATOR,VARIABLE, $25.00

USED TUBES,UNTESTED BY US, SOLD "AS IS,WITHOUT WARRANTY",
These tubes were part of the estate of a long time radio
repairman,who was in business in the San Francisco area
from the 1930's to the 1970's.The tubes were bulk packaged
in large boxes marked "tested ok", however we have not
checked any of these tubes. We have been advised by one
of our customers that some of the tubes we shipped were
duds. These tubes have been priced accordingly.

****
* Shipping for the below tubes to anyplace in the USA: *

1808. Wanted: Audio Notch Filter

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-15 00:00:00 UTC
From: hansfong@ms.hinet.net
Message-ID: <5e3iu4$g4e@netnews.hinet.net>
Source record: 97253

Hello everybody,

Some ten years ago I build an audio notch filter plugged into my earphone socked to filter out those nasty shortwave heterodynes my mother couldn't stand. I just recently pulled out my shortwave radio again, but the notch filter has long gone.

I moved from Holland to Taiwan and there isn't much available here with respect to Ham magazines, libraries or contacts. So does anyone of you have a diagram to build one, or know a place to get one? Ideally it would be available on-line, otherwise maybe someone could be so kind to make a xerox and send it to me (all costs reimburst + a nice gift, of course).

You can mail me directly at hansfong@ms2.hinet.net

Thanks a bunch. Greetings from Taiwan.

Hans van den Boogert

>services.

I might add that unless the radio's that are modified to operate in
other bands cause a problem, the manufacturers have no incentive to
prevent the mods. It took an act of congress to get the scanner/ham
radio's to not scan cell band easily. Yes I know that there are lots
of them that can do that still.

The FCC doesn't look over your shoulder to see what kind of radio you
operate. People are always looking for the cheapest way to get a job
done. If that means getting a ham radio instead of an expensive
commerical, they will do it. The mods are all over the net.

I'm not saying its ok to do this, but that is how the market these days
is geared. The mods have proven to be a very popular feature and will
continue to be included in the radio's.

George

Be aware that these file contain obvious errors. Look at table 2: the E and E3 units seem to be electronically identical, yet their frequency coverages differ.
Mmmm.... Wonder what else is wrong!

However, the end of the grid that is supported/presumably-cooled by the
grid collet is the end that exhibits missing gold.

...snip...

> However, I don't see an obvious big difference in the grid cooling

This seems unlikely since the grid collet is grounded to the chassis with
finger-stock.

> The upshot of all this is that a distribution of dissipation is a good

The length and the diameter of the 8877's grid are about one-inch each.
The grid-collet, contact-ring and finger-stock contact-ring grounding
collet (p/n135305) might add another inch or so.

>but if you assume that it is a

If the grid is behaving somewhat like a vertical antenna, the proximity of
the anode certainly provides plenty of 'top-loading' to reduce the resonant
frequency. However, such is well beyond the capability of my Kenwood
dipmeter.

> These are pretty high frequencies, but not impossible. However the

Possibly---however, the 8938, which is rated at 4kV/1A/1500w-diss./500MHz,
appears to essentially be a coaxial base version of the 8877, but with a Mu
of 125 vs. the 8877's Mu of 200. So, perhaps the 8877 does have a modicum
of gain at 500MHz.

I agree. At VHF and UHF, the complexities can be enormous. Perhaps this is why not many articles on calculating the design of parasitic-oscillation suppressors have been published in QST magazine. The only such article I know of is the one I wrote for the March, 1989 issue.

How many amplifier construction articles explain their design of their VHF suppressors?
I can not recall seeing one in QST or in any publication. Typically, such authors only say something like: wind 5 turns of #18 on a 47 ohm resistor--period ..... To me, this treatment, or lack thereof, has the earmarks of 'cut-and-try' as well as a lack of understanding of what is going on in the VHF-resonant anode circuit of HF amplifiers. This sort of thing bears a certain similarity to the so-called "cures" for bubonic plague that were being sold in the streets of Europe in centuries past.

Russ,
I sheared strips from roofing (copper) flashing. The Ag plating can
then be done using a kit called (I think ?) "Cool-Amp". The kit isn't
cheap, but should be more economical than a plating shop for just a few
feet of strap. 73, Woody

Nope---but I do own a television receiver, AND I am married. Reception is via a TV antenna. If my suppressor-modified SB-220 and my suppressor-modified TL-922 were putting out harmonics, Rick, let me assure you that this fact would be made abundantly clear to me in no uncertain terms.

If you have access to a spectrum analyzer, perhaps you could provide some data to back up your (and Mr. Rauch's) unmathematically-based and somewhat-weary allegations that the sky is falling from a burden of harmonics.

The smoothness that is reported means less tuning anomalies. If you were tuning up an amplifer, and at resonance on one particular band you noticed that there were two peaks in power output as you rotated the Tune capacitor, would you be concerned, Rick?

Hi RIch--

In your last post to me you wrote:

(Rick) >Do you own a
> spectrum analyzer?
snip...
(Rich) "Nope---but I do own a television receiver, AND I am married.
Reception is
via a TV antenna."

Rich, if your TV set picks up the second and third harmonic of an amplifier operating on 80 meters, it must have much wider coverage than mine. Does it also feature a wide-range RSSI meter so you can measure how far down those harmonics are? Don't you think it is a little irresponsible to market a product for installation in high-power FCC type-accepted equipment and have no idea--other than a grid-dip meter and your wife's TV set--what the effect of that device is on spectral purity?

BTW, the other day, I soldered a DC blocking capacitor onto a lead connected to my spectrum analyzer--and the display went wild. Does this mean my soldering iron has VHF parasitics? Do you also make a nichrome choke to fix this?

I hope everyone understands this is against FCC regulations. Amateur tranceivers are not TYPE ACCEPTED for this service. There are reasons for this. I take it no out of amateur band transmissions will be made until a bonfide life and death situation occurs.

You should not publically admit to federal offenses. You admissions are being permanently recorded in archives like DejaNews.

> marine band instead of buying another radio.

Have you looked on the QRZ Website? I've found quite a few mods there.

Now, as an answer to some of the complaints you're receiving about the pros and cons of amateur radios having the capability to transmit out of band-

I am a career firefighter. I work in a <paid> department, and do it for a living. I'm not some yahoo volunteer out to make a name for myself by doing stupid things. (Yeah right, like going into a burning building while others are coming out isn't stupid, but hey, somebody has to do it!) When I got my amateur license, it was then that I found out that certain ham radios could be modified to work out-of-band. At the time, our department was stiffed for funds, and occasionally, some of us would be inside a burning building with no way to communicate with the outside (lack of radios). It was a godsend that I obtained permission from our department's chief to use my amateur HT and mobile to transmit on the fire department frequencies! He understood the EMERGENCY nature of my use, and consented without me even having to use my cattle prod! I've also used my mobile rig when I was off-duty to call the F.D. Dispatcher and inform them of auto accidents that may have gone unreported for long periods of time. Or to let them know that no emergency response was necessary, saving the wear and tear on our engines. At $700 per run, it adds up. Yes, all things considered, it costs about $700 to put a fire truck in the street for EACH CALL! And since we run first-responder medical as well as fire calls, and ran over 5000 calls last year- well, you get the picture. I've only used my mobile to call in accidents four times in 5 years. It's not like I abuse it. I don't call the dispatcher to ask what time it is- it's ONLY FOR EMERGENCIES! If this fellow wants to use his radio in a like manner, WHO CARES!?!? Our department now has more radios, and I no longer must carry my HT into fires. It is my opinion that my use of my amateur HT/mobile on frequencies AUTHORIZED by my department probably saved time, money, and lives. How can you argue with success? 73, Web Williams, KR4WM, City of Myrtle Beach Fire Department, Myrtle Beach, SC

1822. Cold Solder Joints - Why?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-15 00:00:00 UTC
From: John Lockhart <jlockj@minn.net>
Message-ID: <01bc1b5c$387898e0$27c99dcc@default>
Source record: 97267

Hello to the Group!

Any ideas out there why cold solder joints often manifest themselves four or five years after the soldering took place? I used to think a cold solder joint wouldn't work or would be intermittent from day one. Experience with some Kenwood transceivers and this week with a Sony TV is showing me otherwise. Is it related to wave soldering with solders that melt at lower temperatures? Or ?????

Thanks,

John W0DC

> > :>rms.

I have a question about plate to grid capacitance.

Since there is also a fairly large grid to cathode capacitance, doesn't a large part of the plate to grid capacitance current pass on to the cathode, rather than out through the grid terminal, especially if the cathode is grounded and the grid is not grounded, but instead is at some impedance, say 50 ohms, above ground?

If this is true, then doesn't the question of grid current disspation due to plate-grid capacitance become a lot more complicated?

THe FCC, with all their people and funds is now searching the DejaNews
archives to find out who has admitted to federal offenses. They will
then go before an OJ Simpson kind of Grand Jury and get a warrrant for
arrest. The FCC will get a plane ticket and show up to your door and
confront you with your e-mail admission. They will search your house and
confiscate your radios and computers. So make sure not to admit to
violating out of band rules!

>>The funny thing is, his radio can't be modified. Never could.
>>The one good thing about the 212 is the narrow filtering. So
>>he never got the answer he wanted because that wasn't the answer!

Steve - the funny thing is...you're dead wrong.

From the manual pp.17-18 of the HTX-212:

You can extend the memory and transmit frequency range from its
standard 144.6 - 148.0 to 143.0 - 149.0 by holding down the F
and DTMF buttons while turning on the unit. Either way, the
VFOs will tune 136-174.

BTW, being a new ham myself, I just couldn't pass up this Radio Shack
discontinued model. A bunch of features like PLs and DTMF in and out
are standard. Very few of them left out there[1], but when you DO find
them, they are at $200 bucks! And if you take one that may be a display
unit, they will double the one year warranty to two years at no charge!

Now, how could I beat that? :)

1827. [Q] 2 Meter Transciever Kits???

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-15 00:00:00 UTC
From: buster <lathrop@azstarnet.com>
Message-ID: <330585BC.1451@azstarnet.com>
Source record: 97272

Been entertaining the notion to build my own radio.

I've been operating for a little while now, and have been having lot's of fun with SSB on 6,2 and 1296. Weak signal terrestrial has been a blast. I just would like something more.

I was going to pick up a Downeast 70cm transverter kit to play with, but I just purchased an ICOM 451 for 70cm.

I'd like to build a 2 meter transciever. I've checked out the ten tec homepage and the 2m FM kit is just a bit than what I want, and I'd prefer SSB.

I'd like to build a 2-meter, SSB transciever. It doesn't have to be much. A couple of watts output. Maybe xtaled on 144.2 with a little bit of tuning from there(144.150-144.250??). Analog tuning, I don't need any digital stuff. I'd like to eventually get the unit smaller and smaller.

I've heard about the Mihizu vhf ssb "handhelds". I like the idea, just Mihizu's are hard to find, and don't have much output.

I'd like to get a SSB 2m kit to get some experience. Maybe someday I'd work my way to the compact radio...

Anyone make one????

Buster C.

Probably related to a lack of flux, Oxidized solder mix in the wavesolderer,
and improper temperatures.

Hi John

A cold solder joint can make an electrical connection much the same way you could join two components by wrapping solder around their leads without melting the solder. It would work, but there will always be the danger that vibration or something would shake it apart. Maybe not today or tomorrow, but sometime.

If you see a cold solder joint, even if the circuit is working, resolder it, and make sure to use enough heat to get it to wet both the component and the board trace. You dont know when or if it will cause you trouble.

I once had a batch of boards that were wave soldered and looked good at a casual glance. When I tried to get them to work, I found that the solder had wetted to the leads of the ICs fine, but not to the board traces. Each IC lead had a little ball of solder that looked shiny and kinda pushed against the pads on the board without wetting and sometimes made connection. Since the prototype was on a tight schedule, I got talked out of scrapping the boards. Instead I and 3 techs spent the better part of a couple days resoldering every joint by hand on 25 large boards using the special technology vocabulary appropriate to describe the situation.

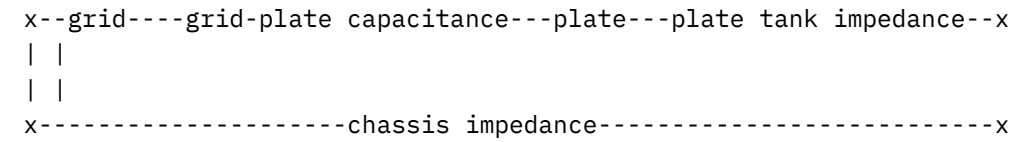
>of the universe, with the exception of one rather unique place in the State
>of Georgia.

Well, that sort of "AC Circuit-Analysis" may work in your universe (far, far, away), but not in the Real World(TM). Kirchhoff's law requires a closed path for current flow, and the topology of a GG vacuum tube amplifier doesn't provide a closed path including grid and plate which *only* includes the grid-plate capacitance, so your simple Ohm's law "AC Circuit-Analysis" fails.

The full mesh also includes the plate tank circuit, and that's about 5000 ohms, and the chassis return to the grid contact, hopefully a very low impedance, but perhaps as much as a few hundred ohms at VHF. So the peak current in that mesh would be at most 2651/5063.66 = 0.52 ampere, not 41 amperes as you erroneously calculated.

In other words, the AC current mesh looks like this:



The DC supply isn't part of the AC current mesh because the plate choke effectively blocks it from participating in AC current flow. Applying Kirchhoff's law, grid-plate capacitance is in *series* with the other circuit impedances, and a current calculation must use the *sum* of those impedances.

The *DC* mesh is different, and further constrained due to the fact that electrons in a vacuum tube can only flow from a source of electron

emission to a receptor of higher potential. In the DC case, the only
significant source of electron emission is the cathode, so grid current
can *never* exceed cathode current. And for the 8877 that's limited to
about 10 amperes peak by cathode material characteristics.

In practice, grid current will be proportional to the ratio of the
grid to cathode potential and the plate to cathode potential, plus
a geometric factor depending on tube construction. For a triode,
that will typically be on the order of 10 to 100 depending on whether
the tube is low mu or high mu, so grid current will be on the order
of 10 to 100 times less than plate current, or put another way, less
than 1/10th to 1/100th of cathode current.

In no case can grid current ever approach 41 amperes. That's pure
fantasy (unless you suffer a catastrophic short of course).

>Anyone make one????

Buster, this sounds like a readymade excuse to buy the R2 and T2
kits from Kanga. These are the Rick Campbell phasing SSB receiver
and transmitter featured in the newest Handbooks. They'll operate
anywhere from 2 MHz to 500 MHz depending on the LO you provide.
A simple VXO should do nicely for the area around the 144.2 MHz
SSB calling frequency. A 1/4-wave (electrical) length of RG-174
will provide the quadrature phasing required. You don't really
need to buy the kits, these radios are simple enough to build
dead bug style on a piece of circuit board. You'll need a PA
for the transmitter, but one of the hybrids from RF Parts will
fill that bill nicely.

This is what I'd call a "weekender" project (unless you want to
make it "pretty", then you could spend more time packaging it
than building it and making it work).

"With no problem"???? How do you you aren't causing problems?
I cannot begin to tell you the grief you cheapskates cause(d) with
your modified radios for those us of who work(ed) in maritime comms.
Suffice it to say that transmissions with radios that aren't type-accepted
are documented whenever possible* and forwarded on to the proper
authorities. Those authorities are sometimes like sleeping giants, but
when they awake you will feel their wrath!

Don't be so damn cheap, Sharples - go buy a VHF marine band radio. West
Marine sells an all-channel rig for around $120.

Jeff KH2PZ (former Coast Guard radio officer)

* USCG coastal stations monitor many channels at once - when your trans-
missions come over two channels at the same time it's easy to determine
some penny-pinching ham is using a modified HT. Hopefully he's not as
cheap in properly outfitting the rest of his boat.

1840. Sound Blaster = easy WEFAX FAX SSTV RTTY

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-15 00:00:00 UTC
From: "Brian E. Cauchi" <gcauchi@keyworld.net>
Message-ID: <01bc1b89$25fdf0c0$0101a8c0@gcauchi.keyworld.net>
Source record: 97285
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc, rec.radio.amateur.space

Hello... Brian here!

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version of my FTV software.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside this software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

Registration promotes the further development of this software and entitles the user to future upgrades paying only for delivery expenses, if any.

Finally, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

1841. Re: 10 Ghz cavity inquiry

Source record: 97286

Most of these Gunn cavities seem to run about 10-20 mw.
The foam rubber seems to be a decoupling element, but I think it might be mostly to keep dust and foreign material out of the cavity. Just retune the cavity after cleaning out the junk. DON'T use conductive foam to replace it. It WILL act like a dummy load.
Do a search in Infoseek for +amateur +microwave and you'll find a few sites. Links at most of these sites will get you the rest of the way.

>intermittent from day one. Experience with some Kenwood
>transceivers and this week with a Sony TV is showing me
>otherwise. Is it related to wave soldering with solders that
>melt at lower temperatures? Or ?????

One way they can fail even months (not sure about years) after application is if the flux rosin that's applied during wave soldering isn't applied at the proper instant or doesn't completely envelop the joint. Then oxidation can set in, weakening the joint with time. Also, if the flux isn't properly cleaned off after soldering, moisture will collect on the flux and, again, cause failure of the joint in time. Neither one of these things should happen very often with today's modern processes tho, let alone with Sony or Kenwood equipment, so there may well be other reasons connected with the solder itself (actually, also a bit unlikely). Solder that melts at lower temperatures shouldn't by itself affect things, but if the solder isn't "eutectic" or "near eutectic" (harden almost instantly, with not much of a temperature range between initial melting and the total liquid state), that could cause several problems in the process. In addition, there will be a build up of "dross" on the soldering equipment, which definitely will lower the efficiency of the soldering process, and is said even to wreck the soldering equipment. However, manufacturers generally like to stay away from "non eutectic" types for just that reason.

All in all, none of this should ever happen. It might well be that the solder joints that failed were simply re-soldered somewhere along the line, and unless that's done very carefully, you know the results. Also, of course, if too little solder was applied initially, that can make a difference even 10 years down the line.

Regards,
Vince, WB2EZG

Used Test Equipment Shipping free in continental USA:

(1) Power Mate BPA-40G, regulated power supply, 0 to 40 volts,
12 amps.Checked, working, but may need calibration and minor
repairs. $150.00

(1) Power mate BPG-40G, same as above,but not checked,
line cord cut,fuse and fuse holder cap missing,otherwise
looks clean. Offered "as is" for $50.00

(1) HP 628A, Signal generator, 15 to 21 Ghz, checked, working,
but may need calibration and minor repairs, $75.00

(1)BIRD 72-2 COAXIAL SWITCH,MANUAL,2 circuit,2 position,
850 W @ 100 MHz, N (f) $50.00

(2)HP G281A,WAVEGUIDE TO COAX ADAPTER,3.95 to 5.85 GHz,
UG-149A to N (f), $7.50 each

(4)HP J281A,WAVEGUIDE TO COAX ADAPTER,5.85 to 8.2 Ghz,
UG-344 to N (f), $7.50 each

(1)HP J370C,WAVEGUIDE FIXED ATTENUATOR,10 DB,5.85 to 8.2 GHz,
WR-137,UG-344, $10.00

(1)HP X375A,WAVEGUIDE ATTENUATOR,VARIABLE,8.2 to 12.4 Ghz,
0 to 25 DB,UG-39, $40.00

(1)HP G382A,WAVEGUIDE ATTENUATOR,VARIABLE,3.95 to 5.85 GHz,
0 to 50 DB,UG-149A, $50.00

(2)HP H382A,WAVEGUIDE ATTENUATOR,VARIABLE,7.5 to 10 GHz,
0 to 50 DB,UG-51, $40.00 each

(2)HP J382A,WAVEGUIDE ATTENUATOR,VARIABLE,5.85 to 8.2 GHz,
0 to 50 DB,UG-344, $40.00 each

(2)HP J424A, CRYSTAL DETECTOR MOUNT,UG344/BNC f,
$15.00 each

(1)HP J487B, THERMISTOR MOUNT, 5.85 to 8.2 GHz,
UG-344 / BNC (f), $15.00

(1)HP R752A,WAVEGUICE DIRECTIONAL COUPLER,10 DB,
26.5 to 40 GHz, missing termination, $25.00

(5)HP X752A,WAVEGUIDE DIRECTIONAL COUPLER,3 DB,
8.2 to 12.4 GHz, WR-90,UG-39, $10.00 each

(1)HP G914A,WAVEGUIDE TUNABLE LOAD,3.95 to 5.85 GHz,
WR-187,UG-149A, $10.00

(1)HP J920A,WAVEGUIDE MOVING SHORT,7.5 to 10 GHz,
knob tuned,UG-51, $10.00

(1)HP 8436A, BANDPASS FILTER, 8 TO 12.4 GHz,
N(m)to N(f),$50.00

(3)HP 11523A,LOAD RESISTOR, feedthrough termination for
HP 420 series detectors, $5.00 each

(3)JFW 50F-006, COAXIAL ATTENUATOR, 6 dB, DC to 2 GHz,
TNC connect, new never used, $10.00 each

(2)NARDA 47G2,WAVEGUIDE ATTENUATOR,
VARIABLE 0 to 40 dB, $25.00 each

(2)NARDA 4773-20 SMA COAXIAL ATTENUATOR, 20 dB,
DC to 6 GHz, $20.00 each

(4)NORSAL 12104 MIXER, SMA CONNECTORS,
NEW NEVER USED, $15.00 each

(1)WAVELINE 60562,WAVEGUIDE ATTENUATOR,VARIABLE, $25.00

Source record: 97291

In article <measures-ya02408000R1302970927220001@news.vcnet.com>, measures@mail.vcnet.com (R. L. Measures) writes:

>Has anyone ever pondered why Eimac does not specify a maximum grid current
>rating for the 8877 or any of the other tubes that are designed for Class
>AB2 g-g service?

The reason is because the heating is due to electron bombardment, and so it depends on the grid cathode voltage and current. It is NOT I squared R loss, so they can give no current limit without knowing the voltage.

>The 8877 has an anode to grid C of 10pF. The 4kV/1A maximum ratings for
>the 8877 apply up to 250MHz. At 250MHz, 10 pF has 63.66 ohms of
>capacitive reactance. According to Eimac *CURVE 4250*, the 8877 begins to
>saturate at an anode to grid potential of about 250v. Therefore, with an
>anode supply voltage of 4000V, the peak AC anode voltage is about 4000v
>-250v = 3750v during the conduction half-cycle when the cathode is driven
>negative. The AC rms anode voltage = 1/2^0.5 *3750v = 0.7071*3750v =
>2651V-rms. When 2651V-rms is applied to capacitor whose reactance is 63.66
>ohms, the current is volts/ohms: 2651v/63.66 ohms = 41.63A-rms.

What a bunch of mixed up rubbish that is.

You not only incorrectly assumed ALL the output capacitance
is to the grid wires, you also gave a completely mixed up analysis.

Rich, better look at the table again.

The grid to anode capacitance is 0.1 pF, NOT ten pF in grounded grid.

Cout is given as ten pF, not Cgp!!!

Rich, you are *very* careless with everything you say.

You are misusing the capacitance from the massive anode to the entire
area around the anode (including the chassis) as the capacitance between
the anode and grid wires.

> ...Sure, 41A is an eyebrow-raising amount of grid current, but this is the
>case according to standard AC Circuit-Analysis, which applies in all parts
>of the universe, with the exception of one rather unique place in the State
>of Georgia.

Before you are critical of me, be sure you can read a simple Eimac
tube data sheet. Reading is an important skill.

Rich, when you constantly throw out incorrect data and false statements,
how can anyone trust anything you say? We have to check out

everything you say, or we can't believe it. Are you doing this on purpose?

When the grid is grounded, the anode to cathode C in an 8877 is 0.1pF. The
reactance of 0.1pF at 250MHz is 6366 ohms. Thus, 2600v/6366 ohms = 0.4A
apparently flows to the cathode.

1848. re homebrew 12v antenna rotator

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-16 00:00:00 UTC
From: jeffg@istar.ca
Message-ID: <5e5opf$i6v@news.istar.ca>
Source record: 97201

Over the past few months I've been asking for tips on building a 12v antenna rotator controller. The roator itself is fitted with a pot that turns as the rotator turns thus changing the ohmage. I can of course read the ohmage on a VOM an extrapolate the readings to N/S/E/W. but does anyone have a better way of converting the readings without using an ohmmeter?
Jeff

1849. Test equipment service manuals

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-16 00:00:00 UTC
From: cripps@netcom.com
Message-ID: <cripps-1502971842120001@10.0.2.1>
Source record: 97202

A while back details were posted of a company that sells test equipment service manuals. Unfortunately, I've lost the information.

Be grateful if someone could repeat....specifically I'm looking for an HP334A manual.

Thanks,

Peter

I don't want to rain on anybody's parade, but there's a good deal of "strange science" going both directions.

I asume it's a slip of the keyboard, but careful editing would be helpful, considering the nature of the debate. The interelectrode capacitance of a tube is a function of geometry, not of the circuit in which it's used. Measurements get a little tricky because all of the elements also have some capacitance to the rest of the world. That's why the discalimer that the measurements were made "in a specially design fixture" appears in the data sheets.

But, for purposes of discussion, the 8877 has a grid-cathode capacitance of 38.5 pf, a grid-plate capacitance of 10.2 pf, and a plate-cathode capacitance of 0.1 pf. These are a function of geometry. Which is input, output and feedthrough capacitance does depend on the circuit, but is trivial to figure out which is which.

All sides in this discussion would do well to heed the words of Mark Twain, "Never argue with a fool. It's hard for bystanders to tell who's who."

>Bob
>WA3TGF
The the use of MSB of DDS is OK at the lower end of DDS range
where the noise sidebands might be tolerable. As you approach the
upper limit (1/2 clock frequency) the phase noise sidebands amplitude
will be very close to the amplitude of the carrier and you will not be
able to filter the sidebands out with low pass "brick wall" filter.
There will be frequencies where there is no fractional division and
the carrier will be clean at those frequencies.

:>

Jim,

There is one thing that will cause the heat damage pattern that Rich describes ... Eimac have addressed the issue but amateurs being very notorious scroungers may well still be seeing the problem ... a bad heat dam design in some production lots of the 8877.

Eimac have redesigned the heat dam several years ago to prevent a failure which literally fried the bottom end of the grid structure. On opening the tubes the observations were identical to those Measures claims could only be caused by VHF parasitics, severe plating damage (melting, evaporation, and redepositon of the gold) to the bottow end of the grid structure with relatively normal (undamaged) upper grid structure.

I have regularly seen "surplus" 8877s advertised or floating around hamfests and understand that at least one tube house will rebuild the 8877. It is entirely possible, in spite of Eimac efforts to rid the market of them, that some of the old design 8877 tubes are still in ciruclation.

Amen, Jim.
OTOH, this admonition only applies to bystanders who don't understand the
subject.

It seems to me that the more a fool talks, the less doubt he leaves in the
minds of others. The recent court case in Santa Monica is a prime example.

Passive grid circuits are also applicable to lower-gain triodes and
big tetrodes. An old 833A I built (back when we got them used for
free) used a 200 Ohm grid-swamping resistor. I used a 4:1 input
transformer and fed the output side up through the center of the
non-inductive resistor used for swamping. The grid impedance
obviously lowers the termination impedance dymanically. It doesn't
lower it much, however, so the impedance swing on the driver wasn't
much of a problem. (This could be a good IPM generator if everything
went wrong--wideband sideband.)

There is a program available for download from
http://www.ipass.net/~teara
called Yagicad 4.1... It is very good for designing antennas. The
problem you'll run into with the cellphone is that if your moving,
you'll have to know exactly where the closest cell tower is and point it
directly at it at all times... if your a fixed station, that won't be a
problem... however, being fixed it would be cheaper to have a standard
phone line.

Later,
DAve

To minimize the chance of regeneration, the (50 ohm) termination should be wired directly to the grid pin on the tube socket. The other end of the termination should be bypassed directly to ground with at least two different values of C--such as 1000pF and 0.01mF. A convenient place to feed the DC grid bias voltage is at the bypassed end of the termination. IF you want the amplifier to oscillate, place an inductor in series with the grid termination.

Neutralizing a grid-driven Class AB1 amplifier greatly improves the input swr on the higher bands. For a neutralized general-coverage, grid-input circuit, see Figure 5 at:
http://www.vcnet.com/measures/

> better to do than to tell me this is illegal (which it is not).

It doesn't matter whether or not it is "illegal." If it saves someone's
life then that is much
more important than whether or not some stupid regulation is followed.

Good luck, I hope you get the mod.

Not with a 360 degree grid current conduction angle, hi.

Measures has had all the heating problems pointed out to him
early in the thread, but he's back at it again.

Earlier he said the 8877 grids were 500 watt rated, now they are in the
multi-kilowatt range.

My puzzlement is how mystical magical parasitics cook
the gold off the 41 ampere grids that exist in the world of pathological
science.

Earlier Richard said his suppressors worked because they
had higher resistance at VHF, now he claims they work because
they have lower Rp.

I think I'll take Twain's advice, and bow out.

Look carefully at Table 2: E receives 144-146 and 430-440, while E3
receives 67-180 and 400-512 MHz.

It appears there is no way to get the 800 MHz band on "K" (U.S./Canada)
models, which should make Newt Gingrich happy.

Page 16 appears to be missing from the JPG images.

Well, aren't we self-righteous today! In any event, as it happens I do own a marine radio. It is not portable, and is attached to my large boat. Therefore, it is not suitable for use in a small boat of the sort I rented on my last vacation. The FT-11 was much more appropriate, and, when the engine conked out in my rental boat in the middle of Puget Sound, I was able to call for help! So sorry I didn't use a "type approved" radio- I suppose it would have been much better for my family and I to row the ten nautical miles or so to the coast. In addition, Jeffrey, you really don't have the slightest idea what you are talking about with respect to performance- I have a fully equipped radio communications shop including a Service Monitor and both a HP and Advantest spectrun analyzer and shielded room. I've looked at both of the radios with respect to deviation, spurs, and frequency stability- they are fully the equal of my Midland marine radio. In fact many of the ham rigs are based on commercial designs or vice versa- for example the IC02 and the essentially identical Aircraft HT's.
So go mind your own business Jeffrey.

Anyone wishing to register opposition for the ARRL/AMSAT submission should send a brief e-mail message to wrc97@fcc.gov. The Subject line should say "Reference No. ISP-96-005 IWG-2A." A simple statement to this effect, "I oppose the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal," will be included in the public record and will help to drive home the point that there is broad-based approval to well conceived 2 metere sharing proposals. It ought to be clear to the FCC the public good is poorly served by allowing hams exclusive use of these valuable
frequencies.

Please note! The proposals the League opposes are not FCC proposals, nor are
they endorsed by any other branch of the government. They are industry proposals. The League's objective is to falsely demonstrate there is broad citizen opposition to the industry proposals.

Additional arguments or evidence also is welcome. Important! Comments should
reach the FCC no later than March 4, 1997!

Uniden HH-979 VHF marine handheld: $159.95. Your family's life is
worth at least that much, and you won't be violating federal law.

>In addition,
>Jeffrey, you really don't have the slightest idea what you are talking

So do you cut legal corners in all aspects in your radio shop
business, or just with your own personel communications?

My comments were directed to everyone who has asked (or will ask
in the future) "How can I modify my radio to xmit out-of-band?"
None of those posting such queries have a fully-equipped radio
shop such as yourself to analyze the results of their modifications
(they wouldn't be asking for such info in the first place, yes?) -
that you're encouraging people to screw around with their
radios without them having the means to check their actions is
morally wrong. If their radios cause problems to other services
(as a result of your suggestions) and they encounter trouble with
the authorities, in their own defense they'll certainly mention
your name ("He told me how to do it!").

I have to wonder about the validity of your radio shop claims -
you said "... cut some <colored> wire..." - that was rather
vague for someone with their own radio shop business.

>So go mind your own business Jeffrey.

That will never happen.

Do you also cheat on your taxes?

****

Don't worry about them. I have done it and I'd do it again. It's not so
much the radio being "type accepted" but rather a matter of money.
People that produce marine radios want you to spend your money on their
junk rather than have some smartassed ham radio operator mod their
own radio to work in that portion of the band they make radios for.

:)

>length. Even if half of the drive power could be directed into the grid,
>that works out to 0.52 watts per grid wire. Does this seem likely to be
>enough energy to melt gold?

Flaws in the argument above:

1.) assuming the power distribution is equal throughout
the entire grid structure.

2.) ignoring the fact the grid is already heated by the cathode temperature

3.) the wire is suspended in a vacuum so there is no convection cooling.

4.) more than 1/2 the exciter power can be coupled to the grid

5.) the heating is due to electron bombardment and is concentrated
ONLY at the outer surface of the gold plating.

6.) Eimac states the maxmum grid dissipation rating is 25 watts.

>otherwise. Is it related to wave soldering with solders that
>melt at lower temperatures? Or ?????

This is very common behavior. Usually, bad joints make a sufficient
mechanical connection to pass test, and often to work for some time
in the field. Then the joint corrodes, and the problems appear. A
good joint is protected from the effects of the atmosphere, a cold
joint typically isn't. So after a time it corrodes and becomes
either high resistance or behaves intermittantly.

No, there's no such permission, it's actually worded as a negative.
S97.403 says that nothing elsewhere in Part 97 prevents a license
holder from any activity to save life or property which are under
immediate threat.

You may see that as an unimportant difference, but I think it is very
significant. What it means is that you have no permission or
imunity to rely on if and when the FCC or some other branch of the
Federal, State or Local government charge you with a violation of
some other statute, only from penalties for violating CFR 47 Part 97
itself.

Regards,

True enough, Terry, but the buttheads in the world are not terribly difficult to ignore.

If anyone is interested in further reading on the subject of VHF/UHF parasitic-oscillation, see: Dittrich, H. F.; *Tubes for R. F. Heating*; N.V. Phillips Gloeilaampenfabrieeken--Eindhoven, the Netherlands. Section 5.8, 'Parasitic Suppression Circuits' begins on page 96.

However, loyal members of the Rauchian camp might do well to avoid Dittrich's book.

Nice try at changing the subject, Rich, but I'm not taking the bait.
Your creative editing can easily be undone to put the point you're
trying to duck back in. (And besides, my power meter doesn't spin

until I provide a *closed path* for the AC current through it.)

[reinstate original]

The full mesh also includes the plate tank circuit, and that's
about 5000 ohms, and the chassis return to the grid contact,
hopefully a very low impedance, but perhaps as much as a few
hundred ohms at VHF. So the peak current in that mesh would be
at most 2651/5063.66 = 0.52 ampere, not 41 amperes as you erroneously
calculated.

In other words, the AC current mesh looks like this:

```
x--grid----grid-plate capacitance---plate---plate tank impedance--x
| |
| |
x---------------------chassis impedance--------------------------x
```

The DC supply isn't part of the AC current mesh because the plate
choke effectively blocks it from participating in AC current flow.
Applying Kirchhoff's law, grid-plate capacitance is in *series*
with the other circuit impedances, and a current calculation must
use the *sum* of those impedances.

[end insert]

>>The full mesh also includes the plate tank circuit, and that's
>>about 5000 ohms, ...snip...
>
>The output Z of an amplifier tube in linear service is approximately equal

>does not win the teddy bear, Gary---however, you may choose between a
>6-ounce bottle of "Babe" shampoo or a 5lb. bag of Bandini.

Very cute. Now try to dodge the fact that the AC current loop *includes*
the tank impedance and the chassis return impedance. *Whatever they are*,
they are much larger than the grid-plate impedance with which they are
in series, so your calculation is *wrong*.

>I stand by my answer of 41.63A-rms.

I'm not surprised that you don't understand Kirchhoff's laws,
no doubt you think you can wire a light switch with only one
wire too, but then I've ceased being surprised that you are an
idiot. When this thread began (long long ago), I was willing
to give you the benefit of the doubt, and even offered some
supporting comments. But now it is very clear that you don't
have a clue. Your theory is voodoo, and any product based on
it is too.

That assumes you are in a fixed location where phone lines are available.
I know of counties where 1/3 of the homes don't have electricity available,
I can imagine most of those homes don't have phone lines either.

I'm a professional educator of electronics and computer service technology. I've only had my ham ticket for about a month now, but I'm learning a lot about this fascinating field. In fact, it was a few of my students that got my interest up in ham radio, and I've done what I can to promote it to my other students. I view it as a national resource... and also realize that it is fast becoming an endangered resource!

Reading these newsgroups has helped me have a better understanding of not only the technical aspects of the field, but the kind of people that are involved in it. The vast majority of the participants in these groups are extremely helpful, and willing to do anything they can to promote amateur radio... proud followers of The Amateur Code by W9EEA!

I've also learned that there are a small number of participants that prefer to use the newsgroups for their own pleasure... attempting to degrade the service and those participating in it. No doubt these types have other interesting diversions when their computers and rigs are down, such poking sticks into hornet nests to observe the reaction. I've been around long enough to know that this type of person will continue to provoke a response until they are ignored long enough. Even

the hornets learn this lesson!

Perhaps the formation of a new newsgroup, such as rec.radio.amateur.whiners-cryers is in order, so that these types can have their own little playground and stop spamming the groups that are helpful!

Also... please don't think anyone identifying himself as a "teacher" speaks for everyone in that profession. Hopefully you too have been around long enough to realize that there will always be a few dog-eared cards in the deck. Fortunately, they are easy enough to identify.

Obviously, I'm opening a path for flames by posting my opinion here... and from the childish battles I've read on these newsgroups, I certainly expect a few. I'll just ignore them. Then the flamethrowers will find another nest to poke.

My two cents...

John - N3YPR

This is my final comment on this subject, so JeffreyH, Busybody,the fellow who openly admits the he "will never mind his own business" will probably end up having the last work.

Many local hams have seen my radio shop and can verify all of my claims to its existence. As for the modifications, I didn't "suggest" that anyone do them, nor did I tell anyone how to (I'll leave that up to the many, many users of the popular Artsci publications I was referring to); In response to a previous post, I merely stated that the modification could be done with success.

As to your other gratuitous comments, get a life Jeffrey! No-one wants to listen to you pontificate out here. Maybe you should get a job for the federal government- there, you can spend as much time as you want in pious oversight of the moral fiber of the rest of us (or perhaps you've thought of that already...)

For Sale:

Hewlett Packard HP 302A, solid state,Low Frequency selective voltmeter, 20 Hz to 50 Khz calibrated in 10 hz divisions on linear dial system. Bandwidth specs: +/- 3.5 hz at 3db down points, +/- 25 hz at 50 db down points, +/- 70 hz at 80 db down points. Sensitivity: 30 microvolts F/S to 300 volts FS (-90dbm/600 ohms f.s.). Tracking oscillator output 1V rms/600 ohms (20 hz to 50,khz). Has DC output of 1 ma for FS meter reading into 1500 ohms or less (scale for a digital VM readout if desired or use with strip recorder). AFC allows for signal capture and hold of up to +/- 100 hz. Also provides a frequency restorer output of input signal of 1 volt RMS for full scale readings. This is an older intrument and weighs around 35 lbs. it is cabinet mounted but can be rack mounted. Excellent electrical and mechanical condition.Shipping weight around 50 lbs.

$150 plus ups on 50 lbs (double boxed) from zip 95827

readings
->without using an ohmmeter?
->Jeff

Absolutely! At the next hamfest, buy a big dc voltmeter. Make sure you can take it apart; if you can't, don't buy it.

Calibrate your pot/VOM system at the four cardinal and intercardinal points (N, NE,E,S,SE, etc...), noting at what voltage readings these 8 points occur. Once done, don't change a thing in the cabling to and from the rotor pot.

You'll probably have to change the attenuation circuit inside the meter (unless its scale matches your VOM). Repaint the meter face as appropriate (N,NE,E, etc...), put it in a nice box, and you're in business.

Good luck...

>at most 2651/5063.66 = 0.52 ampere, not 41 amperes as you erroneously
>calculated.

Gary,

The tube is a time varying resistance in parallel with a capacitance in a complex circuit. While we can ignore most of the complexities at HF, we can not do so at VHF. We don't even know where the ten pF is really "at" in the system, but it's a safe bet it isn't all between the very middle of each grid wire and the anode. The solution is more complex than either of you are presenting.

Rich's math is correct if the tube indeed discharges the ten pF he imagines exists in one spot, and if it charges back up to the voltage he claims.

But the bottom line is this.....

Even if we allow Rich freedom to swing the amount of voltage he likes at 250 MHz, he has no idea where or how the 41 amperes would be distributed.

He is just pulling numbers from his "storeroom" of abstract data, and mis-applying them to a circuit he doesn't fully understand. The whole argument is foolish.

A more important question might be if the grid CAN carry 41 amperes, as Mr. Measures claims, how does a VHF parasitic we can't measure or even see on the meters melt the gold in a fraction of a nanosecond??

You see Gary, he argues against himself at every turn. He whines about heeding ratings (like filament inrush and voltage) when it serves his purpose of making others look bad, and in the next breath tells us the grid will dissipate more power than the anode!

He won't even answer about the suppressor Rp issue. He claims lower suppressor Rp results in more stability. Taking that to the extreme a dead short is the lowest possible Rp and the best suppressor.

He's probably just having fun yanking our chains.

Why Rich,

I'm shocked that you would say that.

Within the last few weeks you changed your his tune about how
suppressors work, plus you have a "one size fits all" nichrome
cure!

Plus you said the following a week or so ago:

In article <measures-ya02408000R0202971344300001@news.vcnet.com>, measures@mail.vcnet.com (R. L. Measures) writes:
>Quite true, Peter---unless the tune capacitor is resonant or near
>resonance. Before this discussion began, I hadn't given much thought to
>how VHF voltage might be able to arc a tuning capacitor. Thanks to Mr.
>Rauch's measurements of a tune capacitor from an AL-80, I think I have an
>inking.

After years of making your claims about plate capacitor arcing,
you now admit never "giving it much thought" and say you are
just now having a "inking"!

Why pick on everyone else when you are doing the same thing?

Come on, Burt....
Let me see ---- public service events (bike races, marathons, sporting events, Special Olympics, APRS at the real Olympics in Atlanta, etc), search and rescue communications (whether on foot, in vehicles, or in the air), coordination of communications for emergency management agencies (from city/municipal to FEMA), and what about hurricanes, tornadoes, wildfires.....

Is that enough or do you need me to waste more bandwidth trying to convince you of something the rest of us acknowledge.

Doesn't say very much about your example, does it Burt? Are you
telling us that you are such a poor teacher and such a poor example,
that you can not guide your students to the more interesting,
productive areas of ham? Please don't say there are none, you and the
rest of us know that that is an outright lie. Of course, if you truly
believe there are NO redeeming features in amature radio, then that
would prove that you are not a good teacher, or at the very least,
lack the knowledge and drive to be a "good" teacher. All that said,
I'm not stating that you are not a good teacher, like I said, it could
simply be that you are spouting bilge and nonsense for some strange
reason known only to yourself.

>It is a vast wasteland.

If your above example shows your ability to motivate our youth, could
it be possible that the same could be said of your classroom?

>Hams can not ignore.

Why should hams ignore? I, personally feel, that is one of the
problems in ham radio. We ignore TOO much. You yourself have
mentioned this. Please make up your mind on how you feel it should
be.

>No you do not. If you find ham radio interesting you will love watching
>water freeze.

You have NO room to talk, Burt. YOU are guilty of being exactly what
you accuse others of being. You are still the UTH (remember that
one), you just use internet instead of ham. I find this interaction
interesting, but it is definitely more boring than talking to someone

live, on air. If this is you idea of interesting, then maybe you'd find watching water thaw fascinating. A "typical ham" (your definition) is still a "typical ham" whether it be via radio or internet>

Wouldn't you know? I just went to my local library to do some research.
Tried to check out the well known text: *Toobs for R.F. Heating* by
H.F. Dittrich; N.V. Phillips Gloeilaamenfabrieeken--Eindoven, Neth.
The librarian said that ALL the copies had been checked out and then
supposedly LOST! He mumbled something about some parasitic Rauchian
group being responsible.
Has anyone else had a similar experience?

Re what was previously posted regarding the ARRL/AMSAT position
on this issue. I would recommend that individuals do their own
research
prior to sending the suggested response. The poster points out that:

"Please note! The proposals the League opposes are not FCC proposals,
nor are they endorsed by any other branch of the government. They are
industry proposals. The League's objective is to falsely demonstrate
there is broad citizen opposition to the industry proposals."

I would ask myself - when did industry ever propose to GIVE any new
frequencies to the Amateur community? As far as "broad citizen
opposition to the industry proposal", the Amateur Community will
generally have to be its own best advocate. We know the value of
the 2 Meter band during times of stress and emergency, the general
public is sometimes quick to forget the acts of service.

The poster also states that your "simple statement" will:

".....be included in the public record and will help to drive
home the point that there is broad-based approval to well conceived
2 Meter sharing proposals."

He appears to be asking you the amateur community to use the same
"simple statement" to support the view favored by industry. Somehow
the logic escapes me - when has the Amateur not lost out in the end
to every "well conceived sharing proposal"?

The poster then wraps up with the following:

"It ought to be clear to the FCC the public good is poorly served
by allowing hams exclusive use of these valuable frequencies."

Pay close attention to that phrase "valuable frequencies"! Obviously
they are of financial value to someone or industry would never have
come up with this proposal. This is $$$$$ speaking - NOT service to
the community, not public relations, and certainly not the voice of
a broad based citizenry.

Anyone wishing to register SUPPORT for the ARRL/AMSAT submission
should send a brief e-mail message to wrc97@fcc.gov. The Subject line
should say "Reference No. ISP-96-005 IWG-2A." A simple statement to
this
effect:

"I fully support the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal." This might be followed by a BRIEF example of a situation wherein the Amateur Service and the Two Meter band was of value to the community in times of stress/emergency.

As noted by the posting, your view -- supporting OR dissenting -- will be included in the public record and will help to demonstrate that there is support for your side of the question. Please do your own research, and don't get caught up in the rush towards "broad-based approval" of either side!

You know the value of the Two Meter Band and you know there are other groups who would like to market a few more Garage Door Openers or some other commercial (read $$$$$ making) devices. Once the frequencies
are gone, there may not be any others to share.

Comments must arrive at the FCC prior to 04 MAR 97

Please note, I apologize for the length of this posting. I was concerned
that the language in the original note ("oppose" the "opposition") might
be construed in the wrong way and do a dis-service to the Amateur Service.

73 Dave K7HMP

Wrong here. If the League alerts its members to a threat to the amateur band allocations, and the membership (and Amateur community at large) agrees, it is by no means a "false" demonstration. It demonstrates that there is, in fact, STRONG, BROAD opposition to the sharing of these band segments with other sevices, as NO method of sharing has been proposed that would not severely interefere with existing services here, especially to the amateur satellite service. I encourage all those amateurs (who have not already done so) to file their comments OPPOSING the sharing of these band segments with other services.

Thanks.

The "false" comes into the picture when the league acts "concerned".
Fact is we have lost, and will loose spectrum, since the idiots in
Newington have promoted this as a "hobby" and dropped the "service". Add
incentive licensing, contests and NTS and you have a good case to get
rid of the whole lot of 500,000! ARRL did not get concerned about
220-222, now the whole band plus 2m and 440? The ARRL stacks the deck,
no doubt, but it (ham radio) is over. I am 34 and have been in radio 24
years. I said 15 years ago, hams were becoming "bookmarks" for
commercial interest. I was right. I work in the communications business
and read industry periodicals. Just wait till you find out we will also
be loosing space on 40/75 meters! This is coming real soon.
Burt, I do not know how you could put "which president do you trust
more?"
on your page. This piece of crap, in lieu of a leader, sells everything
to highest bidder. That is why you support the idea of "sharing" and
"getting along" since Clinton has made it so. For those who read this:
RCR a commercial trade newspaper has reported the Clinton regime plans
to make $50 BILLION off of additional spectrum auctions the next 2

years. They also admit that wireless company officials went to "coffees" at the white house. Now you ask why does Burt support all this? Because by Clinton selling our spectrum, he will get more federal money to use at work along with a raise for nothing! Computers, the internet in every classroom, more education spending..get it? More utopian spending at Burt's place of work.

I do agree 90% of hams are boring and unskilled, but to get to the point, sharing the 2m band will lead to exclusive allocation and then what do you do? I will become an outlaw: guns, scanners, ham radios, cigarettes, etc.

I will see you on 144.410 no matter who "owns" it!
Chris

I have a program available for download from http://www.ipass.net/~teara/ in menu #2. It's a shareware program by Max Froding, and runs under windows. Pretty easy to operate. The registration .txt file suggests that the program can be registered to obtain an upgraded version, but the author doesn't seem to get my emails and the recommended URL is now broken. The program works pretty good, though. Hope that helps...

I don't think it's anything particularly mystical. It's just that the fresh cold joint is usually a good mechanical joint, so the parts are in mechanical and electrical contact. Later, after time and temp cycling have occured, the mechanical joint is still there, but it is looser and there is an oxide layer that may eventually keep the mechanical contact from also making electrical contact.

>| MCL SBL-1 | <-- Stamped in the metal can itself
>| -10 | <-- Printed with ink
>|___________|

The SBL-1 is a level 7 mixer. The dash numbers typically indicate
that the mixer was specially qualified over a certain frequency
range for a particular customer. According to the Mini-Circuits
Designer's Handbook, -10 is not a stock item, but there are other
dash numbers, and they all denote special qualification over portions
of the SBL-1 frequency range, so I think it is safe to assume that
is the case here too.

Simple: He just refers them to the following newsgroup:
news://alt.radio.pirate
Just because this guy has NEVER been involved in SkyWarn, RACES, ARES, or built his own repeater network from the ground up, he thinks these things should be left to the broadcasters, and commercial guys only! He's obviously got the knowledge, and spent some time doing some technical things (he's an extra), but he must now be bored.

1935. WTB- low voltage high current transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-18 00:00:00 UTC
From: OSTERTAGK@SNYCORVA.CORTLAND.EDU
Message-ID: <01IFJB78VNFC000PQD@SNYCORVA.CORTLAND.EDU>
Source record: 97137

I would like to buy a 16-18volt 20amp transformer for my 13.8v power supply project. Do any of you have such a thing for sale? Do any of you know where I might find one? It could be a close equivalent, maybe a 32-36volt CT?

I know that Fair Radio sometimes has transformers, but they are the only supplier I know of. I've been to two hamfests recently with no luck. I have done a few web searches and checked out a bunch of suppliers in Nut&Volts. Someone recommended the Peter Dahl company for a custom made transformer, but that might be too pricey.

Thanks,

Keith, N3KXZ

This may not be of much use but...
There is a company called FCZ(Fancy Crappy Zippy) in Japan that sells
a series of coils, IF cans and kits for radio experimenters. I have been
using their
10mm square IF cans 455 kHz, 9 MHz and 10.7 MHz units. They retail for 180
yen
a piece in single lots. They are available on the following center
frequencies,
0.455, 1.6, 3.5, 7,9, 10., ...50, 144 MHz
Basically all the ham bands are covered. Also the IF cans are available in
a smaller
7mm square size. Especially interesting is the 10mm can, with slug, but no
windings
or caps are great for wind your own experiments.
I am sure that someone must be importing this brand into the USA. If not
ask
a big importer to get some samples.
PEter

PS or find someone who will be visiting Japan to pick up the pieces for you.

>
> :)

It is not impossible to do it... But it is not good engineering practice. Amateur Radio equipment is not type accepted for marine use for a reason; they are not as clean on the output as the type accepted ones are. But if the amateur equipment is used soley as backup to regular marine equipment that is no problem. The real problem is that alot of hams THINK they know electronics and RF theory, and in reality do not. that does not mean that one should not experiment - because it is experience that teaches best of all! So go ahead and experiment, but follow the rules, for they are there for a reason, your service monitors (if you have any) will verify it.

Which is *exactly* my point: the receive ranges differ, yet the diode-matrix
(D302-D308, labeled 'Destination diode' in table 2) is exactly the same.
These diodes tell the unit how to behave. Now if the E and E3 units have the
same diodes, how can they behave differently?

Note that I feel the documents contain a wealth of information,
I was just hoping to keep anybody from opening up his/her handheld and moving
diodes, only to find out there is an error in this table 2. The TH79 is to
precious for that.

> It appears there is no way to get the 800 MHz band on "K" (U.S./Canada)
> models, which should make Newt Gingrich happy.
Still, I see TH79A's advertised WITH 800 MHz in various newsgroups. As I
understand it the older units can receive 800, but the newer ones can not. I
somewhere read in an article that you can see this from the serial number:
===If your serial number is 603XXX or higher, that is all you will get. The
===TH-79A that I have posted is 602XXX
I cannot find the original article though- you'll have to search the net for
it.
There may be a NOSPAM. in front of my E-mail address.
It is there to fool machines, not people.

Rich,

You've exceeded the ratings of the tube.

The output impedance is more complex than Ep over 2Ip.
It requires a Chaffe analysis.

Surely you know that much about PA's!

I believe that this is incorrect. The reason why ham kit will not
pass muster for acceptance into Marine other services is the ability
of the operator to set the frequency arbitrarily instead of only to
the pre-set channels allocated. A 2m HT (<25W) is permitted a
maximum power in any spurious signal of the lower of 25uW and -40dB
versus the mean power at the fundamental, except that it need not be
reduced below 10uW.

Is the spec for the Marine Service acceptance any tighter than that?

Date: 1997-02-18 00:00:00 UTC
From: radiodale@dclink.com
Message-ID: <5ec6ci$h1j@news1.hlc.net>
Source record: 97146
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.equipment

This is the VHF signal generator that covers 10-480 Mhz with output
level of 0.1uv to 1.0v, crystal calibrator and low residual FM.
Internal and external AM are provided. Weighing over 60lbs., you will
probably want to pick this up . I live in Herndon VA, a few miles from
Dulles airport. This is a working unit and looks to be in mint
condition both inside and out. Manual avilable at extra cost.
I am asking $125 for this generator.
Thank you,
Dale

I would say 30% of all hams are active and 10% of those are involved in contests. Those 10% walk all over the rest in their piggish ways of hogging the band.

You are right, I should not use the word "all" as you suggested.

And what percentage of hams take part in the above?
And of those that do, ham communication uses 400000 words when 10 will
do. Hams are horribly inefficent voice communicators.

I'm looking for a 7868 pentode which is the modulator for a Lafayette 6m am rig.
I have found a local shop where they have some, but they want something
like $38 for one.

Can anyone spare one for a price that is not so steep, or suggest where
else I might find one?
The supplier I mentioned above also checked his vendors' catalogs, and
couldn't find an
equivalent in the import tubes.

Thanks and 73

Joel Govostes N1AEP Freeville, NY (FN12)

Is that what it thinks it tells you. When I demonstrate ham radio I make no editorial comment. I offer extre credit for it. If I leave the radio on the comment I get is, "you do not talk to those losers do you." Ham radio speaks for itself. Not even Jesus Christ could convince our youth to get on the air with the current crop of old white fat farts.

If you want to talk direct to the student that has no use for ham radio his address is on my WWW site. See him, he is the #1 student in the school with a perfect SAT verbal score. And he knows the score on ham radio.

>Dave - G3VGR

It's normally about 100 ohms.

Put the tube in the socket, tie a 100 ohm non-inductive resistor
from the filament pin to grid pin (short leads) across the socket
and you can adjust your input circuir with the tube cold.

It'll be close except perhaps on 15 and ten, where regeneration affects
the impedance. By the way, ground the grid leads with short direct grounds,
that's important for many reasons.

Hello to all,
I have the following items for sale.
HEATHKIT
SB600 Speaker, good condition $ 15.00
SB630 Station Console, good condition, manual (clock does not work) $ 35.00
HD-1416A Code Oscillator, manual, works fine $ 12.00
Heathkit Oscilloscope, model 10-10, compact, clean, well built, works $ 35.00

Lafyette HA-230 Receiver, good condition, very clean inside and out, covers
500 khz to 30 Mhz. This unit was made by Trio for Lafyette. No manual $ 85.00

EICO Test Equipment
Oscilloscopes Model 470 & 460, both work, no manuals $ 20.00 & $ 30.00
Signal Tracer, Model 174, works, clean, manual $ 25.00
Electronic VTVM, Model 249, works, clean. $ 15.00
Dynamic Conductance, Tube, and Transistor Tester, Model 666 $ 25.00
RLC Bridge Comparator, Model 950B, works $ 15.00

PACO Test Equipment
Model G-32, TV-FM Sweep Generator, works, manual, clean $ 25.00
RF-Signal and Audio Generator, clean, works $ 35.00

Western Electric USA, model 61C Signal Generator, works, clean,
10 hz to 10 Mhz. In metal shipable case, 22 Lbs. $ 25.00

Mercury Tube Tester, compact unit, with manual, Model 1100A, clean and tested
with known tubes and known tube Tester. $ 35.00

Starkit RF Signal Generator, old Canadian kit , copy of EICO 324 generator,
$ 15.00

Regards,
John Grow

Ever hear of a device called a "battery charger"?

You will frequently find surplus automotive battery chargers
that have exactly the transformer you need. In addition, the cheap
"cracker box" arc welders may have a suitable transformer, or one
that can be easily rewound.

Finally, old computer surplus usually has big-iron transformers.
Drag some stuff home and take it apart -- you might be surprised what
you find. A Teletype line printer gave up my most recent find.

As a last resort, old tube-type TVs with the big iron transformer
will donate a suitable rewindable transformer. These are typically good
for 200 watts or more, which may not be enough, but will be close.

>they are not as clean on the output as the type accepted ones are.

Really? A 25W VHF high-band transmitter is restricted to spurious/harmonic
output of -60dB/c; I haven't looked at the type acceptance regs for
marine gear lately but I don't recall them being more stringent. The
type acceptance regulations for land mobile and marine gear are intended
to prevent an operator from accidently operating on an unlicensed
frequency, hence type acceptance calls for fixed frequencies and
PL tones.

> But if
>the amateur equipment is used soley as backup to regular marine equipment
>that is no problem. The real problem is that alot of hams THINK they know

Oh, I know what you mean!! I once had a ham lecture me on network
standards, you know, CCITT, IEEE, IAB, stuff like that. When I
wouldn't agree with his wrong assertions, he told me I didn't
know what I was talking about! Oh well, at least I don't have
that problem with the _professionals_ I work with. ;-) ;-)

>Department, Myrtle Beach, SC

Can't argue about saving lives, Web. But somebody will probably argue
that the Myrtle Beach Fired Department does not have the authority
to overide the FCC.

I don't think anyone who is a ham has a problem with you saving lives with
your HT. I would imagine the problem comes in because the overwhelming
majority of the Mod Squad are ambulance chasing wannabe Jr. G. Men, or
broke Cocktails On The Fantail sailors who don't wanna spring for real radios
for the boat. Maybe there is a difference between a professional fireman
who happens to be a ham, and an amatuer sailor who became a ham because
the radios are cheap, I don't know......

I'd imagine that the capacitance per foot might get to you eventually.

Using twisted pair as a transmission line is not as strange as you
might think. After all, LANs are routinely built with signalling
rates of 25 MHz and higher through Category 5 cable (a variety of
twisted pair cable which is characterized up to 100 MHz). It doesn't
even radiate very much. It does get pretty lossy above 30 MHz,
though. But for the short distances you're dealing with, I doubt
you'll notice any difference.

One question: are you attempting to control the twists per inch (and
thus the characteristic impedance of the cable) or are you just
twisting it for mechanical reasons?

>In addition, one reference said, "For the ultimate in engineering
>elegance, place a ferrite bead in the middle of the twisted pair." How
>does that little bit of ferrite help the situation?

I don't think that bit of ferrite would change things any more than it
would if you were using RG-174. It merely forces the twisted pair to
stay balanced by breaking the common mode circuit (thus keeping the
line from radiating).

Keep in mind that at least one end of the balanced pair has a
transformer (the mixer) and is therefore balanced. The other end
could also be balanced if you used those wide band phase shifter and
Wilkinson power divider circuits described in the SPRAT technical
cartoons. Given that, the ferrite is really unneccesary.

Message-ID: <5ecu1urus5@mhafc.production.compuserve.com>
Source record: 97166
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

I recently read some of the mail from N3HAU, N3GHE,and N1MYT
regarding a desire to get/find/build NII band digital equipment.
Please add my name to the list. I'm aware of some Part 15 'high
power' gear like Cylink's, but that's too pricey for ham use, and
really designed for pt-pt T1 like links. Is anyone else aware of
5 GHz gear that might be used in a multiple access scheme?

I'd be interested in joining a thread on this topic.

Thanks,

Steve K2PBO

This might sound stupid but.... Is it not possible to re-crystal a childs walkie talkie to a frequency in the 6m band and even add a slight tuning capability. If this is possible could you please Email on how to do this....Thanks.

1967. Q: How to get relays to switch faster?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-18 00:00:00 UTC
From: jdc3538@osfmail.isc.rit.edu
Message-ID: <5ecocf$9ha@news.isc.rit.edu>
Source record: 97169
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

I'm tinkering with a radio for packet use that has a relay for T/R switching. The relay has a diode across it to keep the transistor that runs it from getting fried. So far so good. Every now and then there is mention of how this increases relay switching time, obviously a bad thing for packet. This leads to a few questions:

- How much of a difference in switching time is there?

- What's a faster way of snubbing the induced voltage?

A trip to my home page reveals there are many good files and programs for amateur radio operators that want to use Mac computers.

<http://www.mv.com/ipusers/wd1v/>

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Roster - a virtual "Who's Who" HyperCard stack with more than 780 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and their passions and put a design on your Mac Radio future when you see what neat things are being done!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get with just a click. Many of the programs listed on right there for FTPing.

* Ham Radio.FAQ - compiled on a Mac with a lot of links to great Mac FTP sites for radio, electronic engineering, and similar data.

Hello OM,
I am searching for info about the rectifierbridges (do I say this good
?) of Semikron.
They have the next numbers:
SKB 30/04 A1
SKB B 80/70-4
BSK B 80/70-4
The first one is new, the others are used and old.
Thanks in advance.

> precious for that.
>

Ah, yes, and if you look at the figure on page 6, the "E" has a jumper
at W301, while the "E3" does not, And in Table 4, the TX-RX Unit number
for the "E" is X57-4402-71, while the "E3" us X57-4402-73. Do the X57
indicators imply the configuration of jumpers and/or diodes, or
different firmware? Things may be more comples than just moving diodes
and cutting wires. It's confusing (probably on purpose).

Thanks for saving lives! We all appreciate your efforts. However, the
AUTHORIZATION from the FIRE DEPT. doesn't mean squat. They don't have
the autority to authorize this - it must be done by the FCC. And while
use of ANY frequency is allowed in an emergency (when you can't
obtain help on a ham frequency, you no doubt could have
found another ham to call the accidents in to, instead of using
the Fire Dept. frequencies.

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

Like someone said "It does not matter if it is legal or not, if a life is on the line..."

This is true, if anyone's life were on the line they would probably even use illegal drugs (such as marajuana) to save themselves. I think that what most people are trying to say here, is that for casual or replacement use, it is illegal to use a ham radio for out of band transmission (with the exception of MARS/CAP of course). These radios were not FCC TYPE ACCEPTED for that use, and consequently they were never tested for such use. For one to simply assume that if he clips a wire he can transmit anywhere that he is authorized to do so, is ignoring this regulation.

These radios have very "wide" receive front-ends, and fairly narrow (read: ham band only) transmitt bandpass filters. Attempting to transmitt out of the ham bands on these radios could generate spurs which will possibly interfere with other vital communications in the area. In theory, one might jepardize some other legitimate "life-threatening" situation by interfering with their legitimate communications efforts!

Think about this before you use your Kenwood or Yaesu handheld on the marine bands, or especially on police and fire frequencies. If you insist on taking the chance and saving a few bucks on equipment, at least take the radio to a qualified tech so that they can put it on a spectrum analyzer to make sure that it is transmitting a "clean" signal.

Just a thought. 73's, Steve.

Yes Joel, surf to:

http://www.mnsinc.com/bry/hamfiles.htm

and click on TUBES!

You will get a long list of suppliers and I am sure you can do a lot better
than that price!!

There's nothing wrong with the math here.

gary@ke4zv.atl.ga.us (Gary Coffman) wrote:
>The full mesh also includes the plate tank circuit, and that's
>about 5000 ohms

I just can't agree with this statement. The tube impedance is dependant on the anode current. With the conditions stated (driving the grid until the anode voltage drops to 250V) the resonant anode impedance is about 2KOhms unless the tube is under-coupled. We can assume, arguendo, that we're loaded correctly. And assuming a modest tank Q, the impedance between anode and ground (the effective tuning reactance) is 200 Ohms. That gives a current through the grid of about 10 Amps. But I think that's high; more about that below.

>and the chassis return to the grid contact,
>hopefully a very low impedance, but perhaps as much as a few
>hundred ohms at VHF.

Here's why I don't agree with that statement. If the grid contact impedance were at all significant, a voltage would be impressed on the grid opposite to the grid-to-cathode voltage. The net effect would be to lower the gain of the tube. Looking at tube gain at HF and VHF, I find the gain drops from 15 db to 14 db. I conclude that the reactance of the grid connection is very low.

(Unlike Tom, I suspect the majority is between the grid wires and the anode even though the grid cap-to-anode capacity looks--looks--fairly high. If the majority component of the grid-to-plate capacity is at the grid cap, the wires must still carry the RF current.)

Rich goes on:

>>I stand by my answer of 41.63A-rms.

Even if you're right, Rich--and I don't think you are--you're wrong about the relevance of this value to the argument raging around it. Here's why. The only heat that would be developed by this current is the loss caused by the wire resistance which, being gold plated, is pretty darn low. If you take my calculated value, 10 Amps, the losses are lower by an order of magnitude. And, Tom has stated, quite

correctly, that we don't know exactly where this capacitance is so my value is probably high which lowers the RF current even further and lowers the heating even more.

The thing that bothered me for days is that the anode voltage appears between the anode and grid. And the capacity between the grid and anode has to be charged and discharged. The problem is that you can't find a return for that much current. But, if you take Gary's approach to the circuit analysis, looking at it as a series circuit, then everything makes sense.

You have to think about grid heating differently when you're thinking about RF drive power. When the grid is positive it's attracting electrons (heat). The amount of heating of the grid is determined by the peak grid-to-cathode voltage and the grid current (~80 Volts @ 1 Amp) and the amount of time over the RF cycle that the grid is positive--less than 10%. The grid dissipation, then, is about 7 or 8 Watts. That takes into account the reduced gain at 250 MHz; at 25 MHz the grid dissipation, because of the higher gain, drops to 6-7 Watts, all the above assumption remaining true.

Before this thread get's any further out of hand, I have a couple of
questions:

First of all, this clown is just looking for attention and enjoy's pushing
everyones buttons. He is looking for a response from a large group of
people, and he got it! He's no better than a jammer on your local repeater;
the more you respond to his drivel, the more he enjoy's it. If he is just
ignored, he will eventually go away. Don't give him the satisfaction of a
response, he has shown that he doesn't really care about the issues, he
just like to push your buttons!
Second, he obviously was interested in Amateur Radio at one time, since he
is an Extra Class, and continues to use his call sign in his sig at the end
of every message. I really wonder what his daughter, KA1VBQ thinks about
Amateur Radio? Does he really hate Amateur Radio that much? I don't think
so...His web page has several references, links, etc to Amateur Radio. He
even has some quotes paying homage to CW. Let's see, photo's of him and his
daughter with their call signs prominently displayed, callsign search,
links to Ham Radio info, and obviously very proud to be an Amateur Radio
Operator! At least that's what it looks like from this end!
So Burt, what's the real story? Are you AND your daughter going to give up
your calls? Are you going to continue this rediculous thread? If you feel
such hatred towards the hobby, why don't you show it on your web page? I
look forward to your response and hope you can quit playing this silly game
of yours.

While the tpic of this thread makes intersting reading, there is
something serious here.

We are well into the age of everything electronic -- cash registers,
walkman, watchman, cell phones, cell phones with faxes attached, wirelss
computer printers, wireless internet connections, wireless LANs,
wireless WANs, more cell phones, garage door openers, electronic dog
collars, electronic cat collars, electronic ignition on everything,
wireless tracking devices for UPS packages, remote controls for VCRs,
TVs, stereos, and gas fireplace logs, etc., etc., etc. And it is
getting worse.

How long before someone innocently keys up an HT and crashes the entire
northeastern U.S. power grid?

>- How much of a difference in switching time is there?

On a relay which pulls in in say 10ms, you might see drop out of 35 ms with a diode.

>- What's a faster way of snubbing the induced voltage?

There is a fixed amount of stored energy in the relay coil (1/2*L*I^2). This has to be dissipated. If you limit the voltage to .7V (with the diode), then the current is also small (set by the relay coil resistance), so the energy takes a long time to go.

The fix is to add a zener or similar in series with the diode. I've used a 15v zener, which improved the drop out time to ~12 ms. The drive transistor must be able to take the higher voltage (in this case 15+Vcc, but allow a good margin...). As you go to higher voltages, the time improvement gets less.

(An alternative, which I've not tested, is to energise the relay with its full voltage, and then drop the voltage across the relay to just above hold in point. This would reduce the stored energy, and hence the drop out time. It may also save power)

Given that some of the small relays now quote times < 5ms, relay switching is not to be ignored for packet. I get TXD=50ms to work fine for 1200 baud on a relay switched rig on 2m, and the relay isn't the limiting factor. The ARRL handbook has sequencers for T/R switching, you need to be certain that the various events happen in the right order :-).

Agreed--5000 ohms is porcine shampoo. The peak anode current in, Class AB2 linear operation of an 8877is around 3a. ....BTW, beginning a sentence with a conjunction was uncool in my jr. high school.

I measured the grid-to-anode C on two 8877s. Each was slightly more than 10pF. 2600V-rms at 250MHz impressed across 10+ pF of C equals more than 40A in most of the universe. .
You did NOT show us how you arrived at the figure of 10 amperes, Fred..

The idea that electrons originating from the cathode cause gold to evaporate from the grid, but that electrons originating from the anode don't cause gold to evaporate, is not plausible---unless there are bad-guys electrons and good-guys electrons.

> The thing that bothered me for days is that the anode voltage appears
> between the anode and grid. And the capacity between the grid and

> find a return for that much current.

The main engine that pumps the apparent current through the 10+ pF is the tank circuit. The return to the tank is through the grid-grounding collet and the chassis, which are in series with the grid. The contact fingers on the Eimac p/n 135305 8877 grid-grounding collet are similar to the fingers on 47.3A-per-inch rated Eimac CF-100 finger-stock. Since the circumferential length of the 135305-collet is about 6 inches, I have zero doubt that 40A is within the collet's contact-current capability.

> But, if you take Gary's approach
> to the circuit analysis, looking at it as a series circuit, then
> everything makes sense.

Not everything Gary says makes sense to me, Fred. Gary does not seem to understand that apparent (AC) current is virtually identical to DC current even though no NET displacement of electrons takes place.
>
> You have to think about grid heating differently when you're thinking
> about RF drive power. When the grid is positive it's attracting
> electrons (heat).

The grid is pretty-much grounded, so its potential is virtually 0V. . The grid attracts electons when the cathode is driven negative---i.e., since like charges repel, electrons on a negative-potential cathode are repelled toward the 0V grid.

>The amount of amount of heating of the grid is determined by
> the peak grid-to-cathode voltage and the grid current (~80 Volts @ 1
> Amp) and the amount of time over the RF cycle that the grid is
> positive--less than 10%.

The grid draws current when the cathode is negative. The cathode is driven negative for somewhat more than 10% of the cycle. Why wouldn't grid-heating be determined by RMS values instead of peak values?

>The grid dissipation, then, is about 7 or 8
> Watts. That takes into account the reduced gain at 250 MHz; at 25 MHz
> the grid dissipation, because of the higher gain, drops to 6-7 Watts,
> all the above assumption remaining true.
>
This seems reasonable.
However, the point of this discourse is: Are we to believe that less than 0.5 amperes of DC grid current boils gold off a grid that was designed to carry over 40 amperes at 250MHz?
Boiling and evaporating gold in a vacuum requires well over 2000 deg. F. The engineers who designed the 8877 reportedly concluded that gold evaporation was most probably due to an 'oscillation condition'.
The total length of the 8877's rectangular grid wires in 0.85 inches x 96 = 81.6 inches, or 6.8 feet. The circumference of the grid wires is around 40 thousandths. IMO, in a vacuum, it would take at least 500w to raise such to 2000 deg. F.
I have opened a number of kaput 8877s. I looked at the damaged grids with a 50x microscope. IMO, the damage I saw was unlikely to have been caused by HF currents. The argument of 0.5A of grid current causing gold-evaporation smacks of undiluted technoblather.

I believe that the most likely explanation for the 0.5A/gold-evaporation argument is DENIAL of the incontrovertible fact that the 8877 is a high-Mu device that is quite capable of oscillating at VHF---unless its VHF voltage amplification can be made sufficiently low by reducing the VHF parallel-equivalent R load (VHF-Rp) on the 8877's anode.
The designer of the MFJ-Ameritron AL-1500 amplifier made no attempt to reduce the VHF-Rp load on the 8877's anode
The next time you run into an AL-1500 owner on the air, Fred, ask him/her: How many 8877s failed in the amplifier during the first 12 months of use.
--
BTW, Fred, on page 54 of the September 1984 issue of *Ham Radio* magazine, you essentially stated that the cathode-input Z of a Class AB2 g-g amplifier can be matched with a broadband toroid transformer. Do you stand by your statement?

Hi, this is my list of T0-3 and T0-66 transistors, I use to work for a power supply company that built on demand, at the end of the year the inventory was dumped for tax purposes. All parts are new, unused, surplus.

Would like to get:

$1 each + shipping
$5 for six + shipping
Orders over $20, I ship.

Most of the T0_3 will make very good pass transistors for power supplies. Also have some high current diodes, will post them later.

If you need a personal copy of this list, please e-mail me.

>by your statement?

Of course I do. But only if the conditions I outlined are met. The
situation there was a cathode input impedance that was high enough to
allow it to be swamped by non-inductive resistance. To keep the
grid-to-cathode voltage under control (in effect, to lower the drive
power to the tube) a step-down transformer was used.

As I noted in my article, I deserve no credit for that idea or the
grid-current derived ALC. ETO did both first. What I wanted to do in
that article was to show how their techniques could be implemented in
home-brew amplifiers that protect relatively fragile tubes (8874/8875)
that became very expensive, very quickly.

A man went to a guts store to get some guts for dinner. He sees a sign remarking on the quality of guts offered at this particular gut store. So he asks the butcher: "How much for Engineer guts?"
"3 dollars an ounce."
"How much for teacher guts?"
"4 dollars an ounce."
"How much for ham operator guts?"
"100 dollars an ounce."
"Why is ham operator guts so much more?"
"Do you know how many hams you need to kill to get one ounce of guts?

Well you have the ability to laugh at your self and admit a minor error.
Are you sure you are a ham?

Ham radio defined:

There's just so much more in the world to catch their
eye than a bunch of farts who try to maintain their heirarchy in a
pseudo
secret society, refusing with a vengeance to pass the baton, for fear of
the
tiniest little detail of what's theirs being changed. Even if the change
is
necessary and beneficial to the hobby.

> I have seen you post that comment before. It makes absolutely NO
> sense! "If I have the guts"??? I am confused as to your meaning.

Hams are so gutless that none will meet me on the air to discuss my so
called outrageous views. It is not like I can hit them on the air.

> All kidding aside, my first impression is that you actually do have
> some serious problems. Do you so delusional as to believe that you
> could harm me by merely talking to me?

Maybe not you but most hams I could make look damn silly on the air, not
because I am smarter but I have the facts on my side.

I have the "guts" to talk to
> any human being in this world. Would your conversation be so inane
> that I would die of boredom?

Far less than a TYPICAL ham contact.

I had always imagined it would be an
> interesting conversation. Please explain this "guts" idea. I am
> willing to bet I am not the only one with this question.

You are the only one maybe with the guts to ask.

In article <330b51fb.3089942@news.airmail.net>, jfriley@airmail.net (J. Fred Riley) writes:

>
>The thing that bothered me for days is that the anode voltage appears
>between the anode and grid. And the capacity between the grid and
>anode has to be charged and discharged. The problem is that you can't
>find a return for that much current. But, if you take Gary's approach
>to the circuit analysis, looking at it as a series circuit, then
>everything makes sense.

Hi Fred,

Glad to see this thing get back to common sense.

I disagree with the comment above. The path is very clear, and is not through the tank. The catode to anode path through the tube discharges the anode to grid capacitance. The return for the discharge is through the grid to cathode path.

The charge path is through the tank's impedance, in one form or another. So the charge path is indeed through a few hundred ohms IF you can get the tank to that value. The DISCHARGE path is through the electron stream to the cathode, and the cathode to chassis and chassis to grid impedance.

We can argue all day about where the capacitance is located in the tube, but the end result is the same. The I^2 R losses are a very minor player anyway, the major heating is do to electrons smacking the grid.

The whole argument is silly, because by the time the grid is designed to take the electron heating and support itself, it can carry considerable common mode currents.

Not only that, Rich went off into na-na land with his numbers. The 8877 would be cooked if someone ran 4 kV at 250 MHz, and had a peak anode current of 2 amperes in class AB conduction angle service discharging the anode circuit to a few hundred volts. No one in their right mind would select 4 kV at the upper frequency limit of operation, and then try to drive the anode down to a few hundred volts.

The input power would have to be nearly 4 kW, in the real world the output power would be about 1200 watts at that frequency, and the dissipation would be 2800 watts.

A quick glance shows Rich's numbers indicate an plate efficiency near 70% (something impossible at 250 MHz) and an impossible set of

operating conditions for the tube.

Everyone (except perhaps Rich) understands grid and anode dissipation. Your analysis of the grid circuit agrees with all the other descriptions posted (except Rich's). Remember that the grid dissipation increases sharply when the PA is underloaded.

Arguing about pathological data is a waste of time. Fred, don't you think at any moment someone is going to shout "April Fool"?

I have a friend who has a Drake L4B amplifier that keeps blowing what he calls the "large" transformer, which I am guessing is the plate xfmr. He has had the power supply gone through and replaced the relay. The new xfmrs last about a month, and no tube damage has been done when they go. Anyone have any ideas as to where to look for the problem? Any help will be greatly appreciated. Thanks, John N0EE

From: lekollar@nyx10.cs.du.edu
Message-ID: <5egc22$eqc@nyx10.cs.du.edu>
Source record: 97069

I have an old laptop computer that needs 8VDC, 1.5A for charging &
on-grid usage. The AC adapter that came with it works IK, but I
was considering building a 12VDC adapter for running it in the car
or for emergency use.

Checking catalogs, I didn't find any 7808s with 1.5A capacity, but
I have several 1/2A regulators in my junk box. Can I wire three
of them in parallel to get 1.5A capacity?

Thanks in advance!

Your problem description is sparse. Trying to solve it from afar is like giving a haircut by mail. It would help to know if the failure is an open or shorted winding and which winding. Is there anything else connected to the AC line that could produce voltage spikes? Many times a problem is related to a change that was made. Think back and ask, did I do anything between the time the rig worked okay and when it started having a problem.

Burt,

The part that takes guts is to promote this hobby of ours in a positive
way,
bitching and moaning about how bad things are takes NO GUTS AT ALL and
that's
all I've ever seen from your posts. Nothing positive, no creative ideas
just good
ole belly achin.

Do you have guts Burt?

This sort of thing is one of the reasons that all equipment now sold in Europe has to be CE compliant- meaning that it not only must not emit spurious signals (similar to FCC type B), but also must not be *susceptible* to external RF fields, static charges, and so forth. In this respect the Europeans are ahead of us.

2020. LMB cabinets

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-19 00:00:00 UTC
From: tom martin <tjmartin@ro.com>
Message-ID: <330B98C9.353E@ro.com>

I am looking for a source for cabinets for projects, such as
HF amps, and large power supplies.

Is LMB still in business, or does any one has a source for cabinets.

Thanks

Tom KA7SFL

2021. How to choose FET for VLF loop antenna preamplifier?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-19 00:00:00 UTC
From: scott@gorzarg5.phy.bnl.gov
Message-ID: <5efd42$bh4@sun20.ccd.bnl.gov>
Source record: 97074
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Hello,

I am looking for some references to books or articles about how to
choose the proper FET for use in a VLF loop antenna preamplifier.

The RF design books that I have access to are either too theoretical
and don't go into specs at all, or they are too practical and just
say "use an MPF102 here".

The only recommendation I have gleaned from all of this is that the
FET should be "low noise". But nowhere do they give a number that
I can use when looking at data sheets.

Any help would be greatly appreciated.

Thanks,

Scott

In 3-500Z amplifiers such as the L4-B, SB-220, and TL-922, one of the 1A grid to ground chokes sometimes opens during what appears to be a burst of oscillation in the vicinity of 100MHz that seems to damage Rs. Since the fusing current of the copper wire used in these chokes is over 15a, and the copper wire forms melt-balls at the point of failure, I assume that the grid current was over 15a during the event that caused the choke to open. I can't vouch for the L4-B, but in my SB-220, SB-221, and TL-922, mis-loading is not able to produce enough current to open one of the grid chokes.

In several dozen cases of 3-500Z grid-to-filament shorts, I have not seen a case where a bent grid was responsible for the short. However, I have seen many cases where a 3-500Z's filament helices were bent sideways and contacted the (grounded) grid during an event that operators often describe as a 'big-bang'. [see photo on page 15 in the September, 1990 issue of *QST* magazine.]

Some of the naysayers have argued that an anode-to-grid arc---due to internal gas---is responsible for opening grid chokes. However, over 90% of the 3-500Zs I have tested that had a grid/filament short, subsequently exhibited minimal leakage at an anode-to-grid test potential of 8000v.

In my un'expert' opinion, Jim, a 3-500Z grid-to-filament short can not be produced by mistuning.

> of them in parallel to get 1.5A capacity?

not easily. one of 'em will produce higher voltage/more current and even
with
isolation, you still have one of the 3 tending to hog the job.

better to use a pass transistor with a single, smaller 7808 or better
yet, use one of the newer, more general purpose regulators (LM317 comes
to mind) that can handle the higher power required.

of course, the purists out there will want to you to build a switcher...

No, you can't use them in parallel. LM317 is similar 3-pin regulator with 1.5 Amp capacity. But it is variable output. You need to connect two resistors to fix output voltage. Ask any local electronics shop or National Semi dealer, they should be able to help.

>evaporate from the grid, but that electrons originating from the anode
>don't cause gold to evaporate, is not plausible---unless there are bad-guys
>electrons and good-guys electrons.
>
There is a real difference between those electrons, Rich. The ones going back and forth between the grid and anode stay in the wires and have fairly low energy, The ones from the cathode are removed from the surface of the cathode and accelerated by the grid cathode potential. Those that hit the grid leave behind that energy on the grid. This dissipation can be calculated as V*I integrated over the rf cycle. The contribution of the grid resistance to this loss is quite small by comparison.
On the other hand, the currrent flowing in the grid conductors due to the circulating current in the tank circuit heat the grid by I^2 R effect.. They don't get very energetic (the field required to move an electron in a conductor is quite small) and the dissipation from this source is small compared to the dissipation from the electrons that strike the grid.

To put in the same language you used:

Electrons originating from the cathode cause gold to
evaporate from the grid, but electrons originating from the anode
don't cause gold to evaporate. There are bad-guys
electrons and good-guys electrons.

73 de K9GXC, Jim

PS: The electrons which don't strike the grid get accelerated to even higher energy by the anode voltage. When they strike the anode that energy is lost. This is called anode dissipation. If you look at the anode voltage and current during an rf cycle you will see that when anode voltage is the highest, the current is the lowest (even zero for classs C) and when the anode voltage is lowest, the current is the highest. This has a lot to do with how a tube can make rf with reasonable efficiency. If you screw up the load impedance, e.g. make it too low, the electrons all hit the anode with about the same energy, determined by the anode supply voltage, and the tube gets hot. In this case there is little voltage swing on the anode, so little rf is produced. This, of course is low efficiency operation.

I can tell you what happens for high load impedance as well. The efficiency goes up for a while, but the lower the anode voltage

swings, the less ability it has to yank electrons through the grid, forcing the grid dissipation up. (If you go beyond this you can get clipping of the rf waveform which means distortion and harmonics.)

With respect to parasitic oscillations, the energy in such oscillations is not likely to be well coupled to the antenna or anywhere else so the amplitude builds up until internal processes limit it. Frequently the build up is limited by changing electrode voltages and the oscillations appear as "bursts" on the output waveform. Parasitic oscillations can cause overheating of the grid, but so will light anode loading.

Nicely spotted Bob!
As the green wire is in series with D308, cutting the wire equals removing
D308. That leaves us with an identical diode-matrix for the E2 and the E3,
which have different transmit ranges.....

In reality it was tested that the difference between E2 and E3 is in diode
D304: with D304 it is an E2, without it an E3 (which is equal to E9).

Sigh.... Am I suffering from dyslexia or what is going on here?....

There may be a NOSPAM. in front of my E-mail address.
It is there to fool machines, not people.

Fullerphone MK II, British WW2, These are telegraph terminals
They are in fair to good condition there are 2 ea. One set of
headphones. Price $50.00 for all.

Microphone Headphone combination the mike is marked
"Microphone Hand No. 7 " there is no name or Id on the
headphones. There are other marking that would make one
think that these came from WW2 they have the telltale orange
type of stamps on them on the mike RS-2 & sc5601p. the marks
on the headphones are under the hard ware and I cant read them.
The cord that hooks it all together is of a brownish color with red,
white and blue stripes woven in. The plug on the end is a 5
conductor three sided male plug. It really looks new but dusty.
Offers?

R.L. DRAKE TR-6 original Manual in good condition. Price
$25.00 I'll pay shipping.

Dow-Key #260B-2604 Relay these were made by Dow-Key
while it was part of Kilovac. They are for switching an
amplifiers in and out of line. They have 12 vdc coils and gold
plated contacts. I 'm using one on my DTR 2000 Dentron.
There like having 2 regular ones in one package. Price $50.00

Shipping extra

Been planning to rebuild my old Novice rig with all new components (single 6146 50W oscillator CW rig from '59 ARRL Handbook). Found a nifty dual 400-pF variable but it needs 3.5 inches when open. All the catalogs show the 4-inch high chassis start at 10x17 inches! Does no one make smaller chassis that are 4 inches high? I'd like to do it on a box that's either 8x10 or 10x12 at the most; no need or desire for anything larger.

I've seen some very tiny coax with Teflon dielectric and silvered braid and center conductor that's really nifty for winding common-mode chokes on small (0.71" o.d.) ferrite cores. I only have a 6-inch sample of one type (black, probably non-Teflon outer jacket, 0.070" o.d., 50 ohm, and definitely not QRO). Have heard of a similar white-jacket (possible Teflon) that's closer to 0.055" o.d. Does anyone have any info on these? I am aware of RG-178B/U at 0.075" o.d. and 50 ohms.

Have also seen unknown Zo white non-Teflon coax with at least 98% braid shielding that is *extremely* flexible. Jacket appears to be some sort of silicone rubber, and both braid and center conductor are silvered. I measured 15 turns of that stuff on what appears to be a mix 75 core 0.71" o.d. and found 1.8 milliHenries. That's one helluva choke! Would like to find a source for this stuff, too, since the o.d. is about 0.058". If nothing else, it's very handy for routing shielded runs from one place to another under a chassis.

>Because I am public service minded person.

I'm glad you said this Burt. The Boston Marathon will be running
on April 21st. We will need additional volunteers. I will be part
of a group using APRS software to keep track of emergency
vehicles. I believe this is a school holiday, so you should be free.

Since you are a teacher of electronics, you should be able to
throw together a tracker if you want to help even more. Simply
interface a GPS unit supplying an NMEA sentence to a TNC
of your choice. Transmit on 145.79 (you can use that 2M
equipment in your closet) . The Shareware is downloadable
from various web sites.

If you don't have, or can't build, a GPS unit, just keep the
serial interface of the TNC free and we can program it with
a laptop.

Maybe we can even put your moped to work!

Anyway, Thanks for volunteering!
73,

Steve

I have heard races covered by ham radio. CBers do better.
Hams are horribly inefficent blabber mouths but I bet your group in
the Boston area actually does a lot of good.

> Maybe we can even put your moped to work!

Now that I would be interested in.

I use an off air standard (198kHz)in the UK.
Though the long term is good the short term variation is seldom better
than 0.03ppm because of the path induced jitter.
To overcome this your pll must have a time constant of some minutes ,
this still does not overcome the diurnal variations which can be
greater. The best off air standards (Tracor?) used to have very long
time constants.
Which ever way you go I may be able to help;
Ive got some SC cut Frequency References I bought cheaply : 16.384MHz
(binary devides to 1,2,4,8 kHz etc.) OCXOs that pull +-1ppm
electrically and are good to 0.0001 per second and 0.003 per year
typically. Can supply calibrated to 0.1ppm $90 in postage.
Email me for detailed specs and ssb noise plot.

I have used a small 60KHz amplifier that I have used for calibration.
Here is the full text I have sent to many people. This amplifier was
designed very conservativly. You probably will need an LCR meter to
measure the inductances of the tank toroids.

Have fun.

==========

CALIBRATION SYSTEM USING WWVB AS A TIMING REFERENCE 961106
Print in a plain fixed character width format. Try "Courior New" font.

I have built and used several pieces of test equipment for the calibration of
timing instruments. I have several hobbies including amateur radio,
electronics, astronomy, and of course horology. These all have a common need
for highly accurate timing. I built a specialized receiver to serve as an
absolutely accurate reference for calibrating instruments in each of these
disciplines.

One of my requirements was for a calibration system capable of absolute
accuracy greater than 1 part in 10^9. WWVB is a time keeping transmitter run
by NIST in Fort Collins Colorado. It transmits a partially modulated 60KHz
carrier. At this frequency the radio waves travel parallel to the ground.
These are called ground waves.

NIST also broadcasts short-wave time signals but they are not as useful for
high accuracy timing as the path taken by the radio waves as they refract from
the ionosphere at varying altitudes. This has the effect of making the signals

appear to vary in frequency a small amount over the shirt term.

Another even lower frequency transmitter, 10.2KHz, is the Omega long range navigation beacon at LaMour North Dakota. This station shares this frequency and is coordinated with 8 other Omega transmitters in the world. LaMour is on for 1 seconds out of a cycle of 10 seconds. Each of the 7 other world Omega stations uses 10.2KHz in sequence but is on for .75 sec to distinguish the stations.

Another low frequency reference is the LORAN navigation beacons. These have an advantage because they transmit at 100 to 150KWatt. This is the strongest of the transmitting references. The disadvantage is that all Loran transmitters, there several hundred in the world, use the same frequency, 100KHz precisely, and transmit narrow pulses with varying repetition rates.

Of the several references available clearly WWVB is the best for its simplicity of operation with continuous carrier transmissions. I understand that the accuracy is 1 part in 10^11 at the transmitting site. The short term day to day accuracy is generally 5 parts in 10^12 day to day. This will degrade by a number of factors. As the wave travels over wet, conductive earth or water the curved path length changes because the wave travels at lower altitudes. Humid vs. dry or hot vs. cold atmospheric conditions change the propagation velocity of the wave through the air. All these things and others cause the accuracy at your site to be less that at the transmitter site. I think that all things being equal 1 part in 10^9 is a good worst case estimate of the accuracy throughout North America and it in all probability will be much better. Accuracy should be good for better than 3 parts in 10^8 throughout the world. These accuracy's are for the short term, time scales in the range of minutes to days. The long term accuracy can approach that at the transmitter but this requires specialized integration techniques beyond that in this monograph.

Another more important degradation in system accuracy is the interference due to noise at the voltage comparator. Even though the comparator output is divided by 60,000 to get 1 second pulses the edge of the pulse is determined by the zero crossing point on the incoming wave. If noise interferes with this level then there will be jitter in the sync point on the oscilloscope. Visually one can integrate many traces to average out the noise. A phase locked loop, PLL, can be used at the output of the comparator to integrate the zero crossing point jitter. These can be as simple as a CMOS CD-4046 PLL or as complicated as steering a high stability 10MHz HP reference oscillator.

I will describe a useful Tuned RF Amplifier, TRF, and associated circuitry for a quick calibration of almost any type of clock. All components have been optimized for 60KHz with a 50Ohm input and output. Internal impedance has been set to 5300Ohms as a good compromise for the 100pF variable capacitors and other frequency determining components. The Q was set to 25 for a bandwidth of about 2400Hz. The Q also sets the voltage gain of each stage at about 14db. The circuit should be constructed using good HF/VHF techniques as the transistors used can oscillate in the hundreds of MHz range.

A good construction method is to use a blank PC board for the base. Walls, made of brass shim stock, are soldered around the different stages. Holes in the separation walls bring signals through. The shields prevent self oscillation due to unwanted coupling between sections.

Since the transformers are wound with many turns of wire and the gains are high microphonics may happen. This can be eliminated by hotmelt glue on the transformers and windings after completion of construction and testing.

The transformers are all of the toroid type. I don't have a part number for the ones I used as they came from my junk box but I will describe how to choose them yourself from your junk box. This is an interesting electronic exercise by itself.

The LC circuits needed to have components that were reasonable parts with values that would be both stable and easily obtained. If I made the LC circuits operate at 50Ohms the values, L=1.57H & C=.062uF, got out of hand in size. I then, as a compromise, chose to make the LC circuits out of toroid transformers. Transformers have the advantage of allowing me, through impedance transformation, to adjust the inductance by the number of turns ratio used.

I wanted to use small 100pF variable capacitors of the type used in FM transistor radios. They are small, inexpensive, and stable. To give a 10% tuning range I paralleled the 100pF variable with 500pF mica capacitors. At near midrange this was 556pF in parallel with 95 turns on my toroid which was 12.66mH. I was happy with the combination. You will have to find the correct number of turns on your toroid for a similar match. I suggest that you use the same capacitor values, though, as this type is very inexpensive or free if taken from old radios. Since the impedance of the LC components is, 4771Ohms each and I want to match to 50Ohm I chose 10 turns on my input/output transformer windings. If 75Ohm match is desired the impedance would be 190uH and use 14 turns in my case.

A note about toroid transformers. Turns are counted by the integer number of times the wire passes through the toroid center hole. This means that there can't be any fractional values as a wire either passes through or it doesn't. It is more important to get the LC values correct than to get the input/output impedance's to match. This is just one of many compromises that have to be made when designing electronic circuits.

When testing your toroids a useful parameter is micro Henrys per turns square, uH/turns^2. The inductance of a toroid is dependent on the square of the turns. I usually measure a toroid with 10 turns of wire. This value is then divided by 100. This is the uH/turns^2 value. Use this value to determine the number of turns needed for any inductance. I often use 25 or 100 turns when the toroid is small as my inductance meter is not sensitive enough to measure the single turn value accurately.

There are various chokes in the circuit to prevent unwanted coupling and oscillations. The values of the chokes and associated capacitors have been optimized for 60KHz at a Q of 1. They are not very critical and the values can be within 50% of the ones specified.

This circuit can be used to receive the 10.2KHz Omega navigation broadcasts. Make another amplifier with the tuning capacitors at 1200pF in parallel with a 365pF AM transistor radio variable capacitor. Increase the transformer inductance to 307uH at the 50Ohm nodes and 30.7uH on the internal transformer nodes. The chokes should be increased to about 6.8mH. In my example I used 230 turns and 23 turns on my toroids.

This amplifier supplies DC power to the input coax connection. This power is used to run the amplifier at the antenna without any extra power wiring.

The active antenna circuit is constructed in a waterproof box with the whip antenna attached to the top. The best location for this antenna is on the roof or up a tower. The higher the better. I have use the antenna when placed on a table in the back yard. Try to put it on the side of the house with a clear path toward Colorado. Try to have the antenna outside as noise from electronic devices in the house may cause interference. Of course the lower the antenna the less signal there is to receive. 50Ohm coax cable connects the active antenna to the amplifier. This shielded cable will pickup less noise than an open wire.

The active antenna needs to be grounded for best performance. A good ground rod that is used for antennas only is best. Use #10 gauge stranded or better and remove the sheathing. Slightly untwist the strands and let them weather or tarnish. This weathering can be speeded up by wiping livers of sulfer on the copper. This chemical can be obtained at hobby shops for blackening copper art work. This forms a poor mans "Litz" wire. The multiple insulated strands have lower skin resistance and self inductance than solid wire, especially at these frequencies.

You can try connecting a long wire antenna, about 75 feet in my case, directly to the TRF amplifier through the coax. This works quite well when space is available. The longer the better in fact. The antenna counterpoise needs to be grounded where it enters the coax. The shield of the coax is grounded at this point.

Power for the system can be supplied by a wall mounted DC power supply. Anything up to about 18 volts will work. I used a duel output unit that supplied 12VDC to the amplifier and 5VDC for the logic circuits.

the sound travels only
through metal.

A method I have used for electronic watches and clocks is to connect a small capacitor to the battery. There are small electrical noise spikes that occur when time counters operate. Usually the spikes associated with whole seconds counting are the strongest. Watch them move on the trace to measure the drift rate and calculate the error. This method is particularly useful in adjusting electronic crystals as each adjustment can be observed immediately. When there is no drift there is no error within the tolerances of the system.

```

This method of sending schematics in text form works but can be cryptic. I usually print them then using highlighting pens. I mark the components and traces with different colors. The circuits become easier to recognize. I then redraw the schematics to make them clearer. I still retain the printed version in case of a copying error.

I prefer correspondence through the internet email but I can be reached through snail mail also.

> a pendulum that was impulsed by an electromagnet once per second. Is this
> true? May I ask you a couple of questions about your arrangement?

I don't have a single pendulum. I just use any of several clocks I have around the house.

I have used my system to calibrate and measure my different pendulums.

I have been interested in regulating my local time using the precision radio time reference, WWVB, at 60KHz. In my earlier posts I described my 60KHz filter/amplifier/antenna. With this a stable 60KHz reference local oscillator is adjusted. This stable reference oscillator is used to transfer frequency to a second portable reference crystal oscilator that I use to calibrate my pendulums. This second oscillator can maintaine it's output for a day or so.

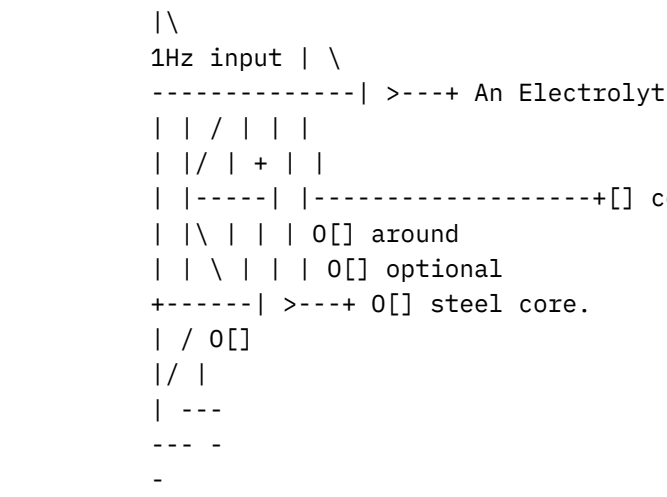
I have diseminated this as an ASCII schematic. This schematic is not easy to read. You need to print it in, plain jane, constant character width format.

Now that I have a local reference it is easy to divide down to a frequency that matches the pendulum I wanted to synchronize. I have an anniversary clock with a 15 sec period. I also have a wall clock with 1 sec period.

The simplest way to synchronize any pendulum is to give it a little kick once per cycle. The simplest may is to have a small electromagnetic or coil close to something magnetic, read steel, on the pendulum. The little kicks induced by the coil will add or subtract movement to the pendulum.

Assuming that you have already got the reference frequency divided down to the frequency of your pendulum.

Several CMOS buffers in parallel



There are a variety of ways to use this driver. If the input is a short pulse then the coil can be placed almost anywhere near the pendulum arc. I usually prefer the bottom of the arc as the pendulum is moving fastest there. This is where the coil can have the most influence in advancing or retarding the movement.

If it is a square wave the frequency should be 1/2 that of the pendulum. Since the coil will be energized only when there is a transition in the input wave and you get 2 of these for each square wave period the frequency needs to be 1/2.

I have also regulated quarts clocks. I have only done this experimentally with some cheap quartz clocks. You know the ones that are all plastic. These clocks have a 32768Hz quartz crystal. I then apply a pulse to the battery terminals. This pulse is about 1uS wide with about 20nS risetime through a capacitor of about 50pF and repeated once per second. This gives the electronics a small kick just as with the pendulum. I think the power needed to synchronize is very small. If you pulse to hard the clock counters skip and the clock runs erotically. Just right and it works like a charm.

I don't agree with Burt's position, Bruce, but I haven't seen any engineering study which would indicate that the SS signals of the LEOs would adversely impact amateur operations. Frankly, I think their signals would have negligible impact on most amateur operations, including most amateur satellite operations. There might be some impact on traditional EME operations due to the slightly raised noise floor, but that's a very tiny part of amateur activity on these bands.

The real problem is the other way, with the relatively high power narrowband amateur operations causing interference to the LEO's terrestrial users. Due to the near-far effect, nearby amateur operators would overwhelm the SS coding gain and cause interference to the receivers of terrestrial users of the LEO services. That's where the danger to amateur radio lies in this proposal.

Once they have the camel's nose in the tent, and have established an economic interest in the spectrum with a large user base, the interference to their operations by amateurs would serve as an excuse for them to go back and request exclusive access to the spectrum, IE kick the amateurs out.

Of course if amateurs also adopted SS systems, and practiced proper power control (required by amateur regulations, but ignored in amateur practice), there would be negligible interference in either direction. But amateurs appear unlikely to do that voluntarily, so conflict would

be inevitable. And amateurs don't wield either the economic or political power to prevail in such a conflict.

We may win this time, and I've dutifully filed comments supporting amateur radio, but ultimately we can't continue to warehouse spectrum. The pressure to effectively utilize the spectrum will continue to mount, and unless *we* start using it effectively, others ultimately will.

This is deadly serious. The FCC has made it very plain that they will no longer condone warehousing of spectrum. They are in the process of forcing broadcast to give up the spectrum it has warehoused. Congress has mandated that warehoused military spectrum be released. And that leaves amateur radio as the only major warehouser of spectrum left untouched. That can't last long.

Here are a few suggestions:

Install a bypass capacitor from the positive lead of the air conditioner
fan motor to ground. Install it as close as you can to the motor itself.

Make sure the fan motor has a good ground, perhaps installing a bonding
strap from the motor case to the car body.

Run both the positive and negative leads of your transceiver's power cord
directly to the battery. Do not use the car body for your transceiver's
ground connection, and do not route the positive wire through the fuse
panel or cigar lighter circuits.

Make sure the transceiver's chassis is grounded to the car body.

Good luck and 73!

Now there you got screwing with me again. I told you via usenet message--and specifically stated in my article--that this techniques was valid only when you had sufficient excess drive to allow the swamping resistor to stabilize the input impedance by absorbing a large portion of the RF drive. And I don't want you to believe it--I don't give a flying you-know-what if you believe it. It's been done. And is being done every day in hundreds of amplifiers.

I have, however, rethunk my analysis of the RF current in the control grid and find that, under the conditions stated, it is in excess of 40 Amps. That number is defensible.

Yep, the math is fine. It just doesn't describe anything that happens
in the amplifier.

Hold the phone. In one breath you accept a RMS plate voltage of 2651,
and in the next state it is 250. Which is it? It can't very well
be both at the same time. If the voltage is 2651, and we neglect the
other impedances in the current mesh, we get Measures' number for
grid current. But if it is 250, and we continue to neglect the other
impedances in the mesh, we only get a grid current of 250/63.66 = 3.92
amps. That's much less than Measures' value even neglecting other
impedances in the mesh.

The tube's plate impedance is the slope of the load line. That's

1) Zl = (E2-E1)/(I2-I1)

Where Zl is plate load impedance, and E1,I1 and E2,I2 represent
two points on the loadline. Another way to state plate load impedance
is

2) Zl = (Eac)^2/Po

Where Eac is the RMS AC voltage at the anode, and Po is the power output
of the stage. If we accept the Eac value supplied by Measures, and assume
a legal limit output power, we get a value for Zl of 4,685. For the sake of

illustration, rounding that to 5,000 should be perfectly fine.

As a sanity check, an approximation of plate load impedance is given by

3 Zl = (Ehv)^2/(2*Po)

Where Ehv is the power supply DC voltage. In Measures' strawman case, that was stated to be 4,000 VDC, so Zl = 5,333 ohms. Again that will round to 5,000 ohms for sake of illustration.

>>and the chassis return to the grid contact,

Ok, the impedance from the chassis side of the tank back across the chassis to the grid contact behaves as a transmission line. At 250 MHz, that distance can represent a fair portion of a quarterwave (depending on layout) and will show a fair impedance. It won't be high because the "line" is wide, but it could reach a few hundred ohms in a loosely laid out amp (assume for example a stripline tank). Now that's only significant in relation to stage power gain when compared to the plate load impedance, which is at least an order of magnitude greater in this case, so we don't have to be too concerned about it. It will still allow a gain of 10 to 20 for the amplifier. But it is significant compared to the Xc of the grid-plate capacitance, and must be included in any calculation of grid-plate AC mesh currents.

RE: The naysayer-'guys':
One of the naysayer "guys' has a reputation for not understanding algebra
and appears to be curiously-uncomfortable with scientific notation. He
rejects AC Circuit-Analysis out-of -hand whenever the results cast doubt on
one of his utterances. I believe that he has been kidding himself ever
since he quietly cancelled his article of 28 Nov. In that article, he
experimentally added a few ohms of ESR to Ls. The calculated result was a
small reduction in VHF Q---as expected---and an UNEXPECTED,
substantive-reduction in VHF Rp. ..... Oops ..... Since voltage
amplification is basically Mu*Rp, less VHF-Rp in the anode resonant circuit
means less VHF voltage amplification---which is hardly good news for those
trying to build a VHF oscillator or for those trying to defend
silver-plated VHF "suppressors".. In December, 1996, Wes' (N7WS)
scientific measurements confirmed that making Ls out of resistance-wire
decreases Rp. Thus, Mr. F. E. Handy was proven right 70 years after he
wrote about VHF suppression in the 1926 Edition of *The Radio Amateur's
Handbook*.
(Note: *The Radio Amateur's Handbook* is history. It has been replaced by
The ARRL Handbook for Radio Amateurs).

Another one of the naysayer-guys would like to have us believe that an
8874's complex cathode-input Z can be matched by a broadband transformer.
What does Eimac say about the input circuit for the 8873/8874/8875? On
page 6 of their Technical Data, Eimac says:
"When any of these types is operated as a grounded-grid RF linear
amplifier, the use of a resonant tank in the cathode is recommended in

order to obtain the greatest linearity and power output. For best results with a single-ended amplifier it is suggested that the cathode tank circuit operate with a "Q" of five or more."
The scientific reason for the need of an input tank circuit is: the driving impedance fluctuates from under 30 ohms to many thousands of ohms during the driving voltage cycle. However, broadband transformers can't handle this sort of load satisfactorily. A tank/flywheel circuit can.

On page 13.13 of 1995/6/7 editions of *The ARRL Handbook for Radio Amateurs*, one of the naysayer-guys said:

"A significant portion of circulating tank current therefore flows through the blocking capacitor. As a conservative and very rough rule of thumb, the maximum RF current in the blocking capacitor at 28MHz is Ic-block = Ip + 0.15*Cout*Vdc, where Ic-block = maximum RMS current through the blocking capacitor, in A. Cout = output capacitance of the output tubes, in pF. Vdc = dc plate {anode) voltage, in kV. Ip = dc plate current at full output, in A. "

The problem with the formula "Ic-block = Ip + 0.15*Cout*Vdc" is that it is algebraicly indeterminate. It could be taken as Ic-block = (Ip + 0.15)*Cout*Vdc, or it could be taken as Ic-block = Ip + (0.15*Cout*Vdc). Given: An 8877 (Cout=11.2pF max.) operating on 28MHz from 4kV at 1A. Calculating the maximum current in the DC blocking capacitor, Ic-block = 51.52A by one formula and Ic-block = 7.72A by the other formula. Which answer is right? Apparently, neither. I calculated the current through the DC blocking capacitor as approximately 2600v/507 ohms = 5.13a RMS. Apparently, we should not expect our "recognized amplifier experts" to be algebraically-literate or to understand AC Circuit-Analysis.
Why has the ARRL allowed this blunder to appear in 3 issues of the ARRL Handbook?

It seems to me that this discussion has been more about hubris, denial, sycophancy, and psychohistory than about science.
On the 'good source of amplifier tips' thread, science which refutes technoblather has been touted as "bad science"---and science that props up technoblather has been touted as "good science".
Which side of this discussion has largely ignored Wes' scientific measurements?

IMO, The "serious investigators who have their reputations riding on their designs" are most serious about defending their reptutations.
In the David Frost/Richard M. Nixon interview which took place shortly before Nixon's death, Frost tried to get Nixon to admit that he (Nixon) ordered the Watergate-breakin. ....However, Nixon chose to defend his reputation to THE END.

....."These guys" are not kidding me. They apparently are kidding themselves. .....

>the Boston area actually does a lot of good.

Even Better Burt! Since APRS is digital (but you knew that) you need
not hear any of that horribly inefficent blabber. Just objects on a computer
screen.

BTW, As a former police dispatcher and PO (I even worked in Yarmouth,
hey, maybe I arrested you!) I understand your comments about communication.
But it's easy to critisize from the armchair, isn't it? I have been in radio
communication situations in which life depended upon good skills. Since
a lot of that experience was on the Cape, maybe it was a life of someone you
knew. I don't take this stuff lightly.

I still have a cottage in Dennisport BTW (off Old Wharf Rd.) I even have a
weather station there you could monitor if you were on APRS.

Steve

Use extreme caution. Many laptop chargers have charge control circuitry
in the wall brick. If you just stick 8V +/- 5% with arbitrary current
limit to your laptop, you may explode the battery or some other
internal circuitry. I speak from experience.....

I have an inop TR-4 with manual, but schematic is incorrect. V4 is a 6HS6
in my rig, but a 6EJ7 in the radio.
There are other differences also. This radio is not the C model either. Did
Drake make some changes in
the basic TR-4? H-E-L-P!

Well, I admit that my profession is computer science and radio is
primarily a pastime for me, but that doesn't lessen my ability to
read Volume 47 of the CFR and understand the reasons for type acceptance.
I don't need to own a service monitor and get paid to tweak radios to do
that, do I?

If you're trying to bring my credibility into question, please
explain why. Was my comment about the basis of type acceptance
incorrect? Hmm?

;-)

>Hold the phone. In one breath you accept a RMS plate voltage of 2651,
>and in the next state it is 250.

No, No. I was looking at the grid-to-cathode voltage necessary to swing the voltage down to 250 V to get the drive power. Recollect, he said and anode voltage of 4K swinging down to 250. And I was assuming an higher power output, noted below.

>The tube's plate impedance is...4,685. For the sake of
>illustration, rounding that to 5,000 should be perfectly fine.

You're right. I calculated the impedance on the maximum power available within the tubes ratings, not the legal limit.

>Ok, the impedance from the chassis side of the tank back across the
>chassis to the grid contact behaves as a transmission line. At 250 MHz,
>that distance can represent a fair portion of a quarterwave (depending
>on layout) and will show a fair impedance. It won't be high because the
>"line" is wide, but it could reach a few hundred ohms in a loosely laid
>out amp

I'm not trying to be obtuse but I still don't agree. Here's my problem with your analysis: If the voltage on the anode, with respect to the chassis is 2600 VRMS and the grid-to-plate capacity is 10 pf, then the current is 40 Amps. I cannot view it any other way yet--although I'm trying. This nagged at me until I trudged down the hall to visit a few of the old timers, telling them of my reluctance to believe what was calculated. The unanimous opinion--right or wrong--was that the grid RF current is equal to the tank current. And that the tank must resonate out the reactance of the tubes internal capacity. If the tank resonated out the GP capacity, the circulating current in the grid is the tank circulating current plus the output current (which is fairly small here). I've tried to look at it as a series circuit and can't agree with that approach. I also don't like the fact that the operating Q appears to be 75!! That alone makes me think my approach might be wrong.

I'm an eager student. I'm willing to admit to a mistake in logic which it's pointed out. But let's just say Rich might be right, arguing by analogy. The 5CX1500B is widely used in FM broadcast service. The Suppressor Grid to Anode capacitance is about 15 pf, roughly 100 Ohms at 100 MHz. This capacity is used to shorten the 1/4 wave line that the tube has as its output tank. [Now think about that: we're presenting a shortened line section to the tube whose

inductive reactance resonates the total anode-to-ground capacity of the amplifier and gives an operating Q of 30, high--but believable.] Operated under normal conditions for 2500W output and 4350 VDC HT supply, the RMS RF voltage is about the same as the previous example: 2600 volts. If I'm approaching this correctly, the current in the suppressor (which also happens to be rated for 25 Watts) is 26 Amps. Twenty-six amps sounds all the more reasonable when you think about what happened when Eimac changed the suppressor grid contact plating from silver to nicket. Suppressor grid contact ring failure started to occur everywhere, burning the contact fingers in two. If the current were lower, that should not have happened; there just wouldn't have been enough current.

Now, the important part about the above example (at least to me) is that the 25 Watt suppressor grid had no trouble with damage caused by the RF current. This argues that the high RF current causes no significant heating of the grid structure--the arguement that I made to Rich about his 8877 example.

Gary, if I'm wrong about my analysis I'll be happy to admit my mistake. But I think I'm right which, God help us all, means Rich was right about the RF current. Not the implications of the current, just the current.

Burt, Just what are you doing to make ham radio more interesting to the young folks. What are you doing to bring more young folks into the hobby and keep them there??

It is real easy to sit back and spout a lot of hogwash about how boring, and how stupid and all of the rest of the blah blah blah that I see comming from you.

Have you started to put together a high speed packet network, at a speed high enough to use the internet browsers on? If computers interest the kids, Add computers to the radio, only do it at a speed that will hold their interest. If you come to Dayton this year look me up. The Consolidated Electronics Booth as I work for them and get stuck there for the three days. I will introduce you to a friend of mine, in fact several. One started the 19k2 network around here on 440 several years ago. He and I along with hams around the country are trying to get 900 megs off the ground with spread spectrum. All to get more speed so that ham radio can compete with the internet. Another friend is a scout leader, Their class this time around has over 40 students, all looking for that ticket as he has made ham radio interesting to the scouts by arrainging field day out at the scout camp. He has set up a satellite station to work the birds with the boys right there.

Ponder those things Burt, You claim to be an educator, yet you cut, slice and condem rather than teach and enhance. I have kept my silence for a long time now and read what you have said. Perhaps I should continue to keep it, but I feel that someone has to point the truth out to you as you seem to be oblivious of it. There are many of us out here trying to put the ham back in ham radio and make it fun again, both for us and the young folks. Please quit lumping all hams in one heap and cutting us down. You are the one that gives ham radio a bad name to the non hams that read the news groups that you post your tirades to.

Fred ke8tq ke8tq@n8acv.#day.oh.usa.noam

Come to Dayton this year and stop at the TAPR booth to say hello......

Schembri - recrystaling should be possible but you would have to put in new tuned circuits and get the superregenerative receiver to work on the higher frequency. A bit fiddly though.

As for the tuning capacity, as you will be using 3rd overtone crystals, this is pretty well impossible. You would have to make a VXO on HF using fundamental crystals (or even overtone xtals on the fundamental freq) and multiply upwards. This would get so messy that you'd be better off building a rig from scratch.

Have a look at Solid State Design for the Radio Amateur. There's a circuit of just what you are looking for - a VXO 2m DSB transmitter with a tuning range similar to what you want and a power output of a watt or so. It would be interesting to add a direct conversion receiver to get a transceiver.

Assuming you're using an xtal controlled handheld CB or even one of the older rigs that were xtal controlled, only a little tweaking and no component changes would be required. This would be quicker than buying a kit or building something from scratch in my opinion.

>Why wouldn't
>grid-heating be determined by RMS values instead of peak values?

The only time the grid is heating is during the time it draws grid current. The correct solution to determine the grid power dissipation is to solve the equation for the integral of voltage * current during that period. A rule of thumb for this service--this service-- is that the peak current is about ten times the DC current. That peak current olnly occurs at the peak of RF drive. So we have to integrate the value over time. Because most of the time there's no grid current. Again, you can do the math to get the exact value for sinusoidal drive but you can get a close result, as in my example, by multiplying the DC grid current times the peak grid-to-cathode voltage. Let me just say again that this is not the exact value. But it's very close: 8 Watts.

> Are we to believe that less
>than 0.5 amperes of DC grid current boils gold off a grid that was designed
>to carry over 40 amperes at 250MHz?

Well, again, yes you must believe that. Think about an electric welder. The reason you use DC is to keep the electrons hitting the work piece and not heating the welding rod. The heating because of RF current is a function of the resistance and current only. The Grid current heats the grid too. But the average current is so much lower than the circulating current we can reasonably ignore it.

> The next time you run into an AL-1500 owner on the air, Fred, ask
>him/her: How many 8877s failed in the amplifier during the first 12 months
>of use.

That doesn't prove a thing, Rich. It's all anecdotal and proves nothing. Look at one example: I designed the 600 KW MW transmitters in use at Radio Kuwait. And I ran the grids quite nicely, thank you. The PA grid was heavily swamped, and operated well within their ratings. The PA's were absolutely stable; you couldn't make them oscillate if you tried. But we lost three 4CM400,000AG tubes in seven weeks. It wasn't a bad design on my part. Eimac got some bad screen grid wire and the impurities were causing the screen grid to warp into the grid. I was only running 4000 Watts of screen grid dissipation (and they're rated for 7500 Watts) so my design didn't do the tubes in. You can't blame me for those tube failures. And it's wrong to say, on the basis of anecdotal evidence alone, that some other

designer screwed up because a tube fails. In the 600 KW MW I put in for VOA Kuwait, a Thomson TH-558 failed during its tests. Same type of failure. My designs starting to look suspicious. Well, not exactly. The shock watch indicator on the shipping carton was smashed all to smitereens. Just as one of the grid insulators was. When the defective tube was replaced with a shipping survivor, the PA worked and hasn't stopped since.

No matter what you think, these guys aren't kidding you. They are serious investigators who have their reputations riding on their designs. If they had a failure mechanism to control failures they'd implement it in a minute; there's money involved here. If you'll just rethink these threads, remove all the emotion and start with an open mind, your conclusion must be, in the final anaysis, that the mechanism you have described is not the mechanism that killed the tubes in question.

Message-ID: <19970219151300.KAA12062@ladder01.news.aol.com>
Source record: 97085

I'm looking for pointers from anyone that has gone through the exercise of building a WWVB locked local reference. I would like to get around the continual recalibration of my counter's internal reference. To accomplish this I plan to phase lock another (external) reference to WWVB (off the air) with the hope that I would be able to achieve an error no greater than 0.05 to 0.1ppm (my external reference is quite capable of holding to better than this for some period). I'm using the counter for frequency determination on 2.3GHz today, and plan to move up to higher bands soon.

Any schematics, pointers, or other suggestions based on actual experience in locking to an off the air reference would be appreciated.

Thanks

I wouldn't try paralleling...
Email me for address, send SASE (actually a small box :-), I will return
it with a 7808CK. That is the 8 volt reg in the TO-3 package and (I
believe) is rated at 1.5 amps continuously (w/heatsinking).

Hola, Jorge!
There are mag-mounts with 3 or 4 magnets that should hold your antenna. Otherwise, here are 2 ideas that may help your swr when you move the antenna. First, make sure you have a good ground. Much better than you ever thought you'd need. Without a good ground, your mobile antenna will have a LOT of loss. This may not be your problem, because if you have a lot of loss, your swr curve will be pretty broad if you ever get it tuned.

My mobile antenna is mounted on the back bumper of my pickup. It never matched very well until I tried this. I got a small coil, about 10 turns, 2-1/2 inch dia., and used it as a shunt feed. The bottom of the coil is grounded to the truck, and on 40m I put a clip lead about 2 or 3 turns from the top to the feedpoint of the antenna. This is a bad description, but if you look in the ARRL Handbook or the Antenna Book, it has pictures of how to do it. Now my swr is about 1.5:1 and bandwidth on 40m is about 35 or 40 KHz between 3:1 points.

Could somebody please post Burt Fisher's home address and telephone number on these newsgroups he keeps crossposting to so we can call him (like maybe when I'm reading the news at 2:00 A.M.) and tell him what we think of his abusive drivel and/or mail him dead rodents and such?

I read somewhere about some guy being a public pain in the ass and being subscribed to like 300 "bill me later" subscriptions to everything from porn magazines to Forbes. Surely somebody out there has a similarly wonderful idea about how to deal with Butt Fisher. If he wants to make himself a public figure, then we can treat him as such, you know posting details about his formerly private life, what kind of undergarments his wife wears, etc. I'd suggest to Butt Fisher that life as a private citizen is a little nicer than life as a public figure. I think a good argument can be made that his repeated controversial postings on USENET already make him a public figure. Thoughts?

Some people could constantly mail bomb his account until his ISP cuts him off. Of course, he could switch to another ISP, and then the mail bombing might start again. However, I'm not recommending such a thing....

But..., its real easy to set up a cron jobs under unix to send it a huge 100k message every five minutes. If 50 people started doing that ... well, you get the pictures.

In case you missed the number of birds...
From Edupage:

TELEDESIC LOOKS AT SCALING BACK
Teledesic Corp., the high-profile, $9-billion satellite communications project backed by cellular magnate Craig McCaw and computer mogul Bill Gates, is exploring options to scale back its 840-satellite system, beginning initially with just 288 "birds." The satellites will occupy a low-Earth orbit, 400-700 miles above the Earth, circling in 12 orbital planes or "rings," with 24 satellites in each ring. A spokesman for Teledesic says the company "has not altered" its original plan, but may start off with a more modest arrangement. (Wall Street Journal 19 Feb 97)

> 73 de KB2YVC + DE8FGO, Siegfried

I can't resist this one. Capacitors are no mystery. The BASIC
equation for ANY capacitor (including varactors) is:

(dielectric constant of vacuum)*(area of plates)
Capacitance (fd) = ____

plate spacing

dielectric constant of vacuum = 8.85e-12 fd/m
area of plates in square meters
plate spacing in meters

If you want, do the appropriate unit comversions (I personally like
metric). In case you forgot, the area of a circle is
2
A = pie*r .

Then multiply by the number of plates. You shouldn't miss the actual
maximum capacitance by more than 5 %.

This is true. You can't see a thing on his web site unless you let him execute Media Player on your machine. I've got a problem just allowing executables being sent to, and run on my machine to suit someone elses whim. With this guy's attitude, who knows what you'd end up with.

A friend of mine found and passed around these plans for an Eggbeater antenna. They're good for omni-directional horizontal and up-pointing circular polarized, which makes them good for non-seeking satellite stations. They were posted to the net in '95.

Source record: 96950

FWIW... Changing the hook-up and adding one resistor of the appropriate
value and power rating will change the device from a voltage to a
current regulator.... Also, I think the 7808 will self-limit, but
don't know what the exact value might be...Have to measure, but would
guess is maybe 2 amps?
The short circuit current is rated as 750 ma. _Woody_

I've found that Bagpipe music is useful convincing neighbors with
bigger sound-systems to close their windows/patio doors.

With only 30W into a GE loudspeaker, mono, I got the 100W+/channel into
Cerwin-Vega's rock&roller to close his balcony slider...
Album was "Controversy of Pipers", a scottish bagpipe festival;
should still be available from Roundup Records.

Radio Books

1. Industrial Electronics by Gulliksen and Vedder
First Edition 1935 245 pages
Excellent condition
Price $10 Shipped

2. Electronic Engineering Handbook by Batcher and Moulic
First edition 1944 456 pages
Excellent condition
Price $12 Shipped

3. Fundamentals of Vacuum Tubes by Eastman
Third Edition 1949 644 pages
Very Good Condition
Price $20 Shipped

4. High Frequency Measurements by Hund
Second Edition 1951 676 pages
Very Good Condition
Price $20 Shipped

5. Dictionary of Electronic Terms by Allied Radio
Seventh Edition 1965 88 pages
Excellent Condition
Price $5 Shipped

Will trade any of the above for ARRL Handbooks and or ARRL
Publications Pre-1970.

Also collect Old Amateur Radio Log books and anything of historical
interest to Amateur Radio.

Thanks

Hola estimados amigos y colegas:

Desearia ponerme en contacto con otras estaciones que tengan
el equipo ICOM 706 para intercambiar impresiones.
Me gustarï¿½a que me resolvierais algunas dudas, como la
potencia que realmente os sale en SSB HF, si el VOX funciona
correctamente con otros micrï¿½fonos, quï¿½ micrï¿½fonos usais
ademï¿½s del original de mano, decidme si el altavoz interior
os vibra o distorsiona un poco cuando se sube el volumen,
etc. Cualquier comentario al respecto o cualquier impresion
sobre el IC-706 es bienvenida. Tambien mejoras y
modificaciones, asï¿½ como experiencias en mï¿½vil, etc.
Espero vuestras respuestas, yo estoy a la espera de un
software para controlar el IC-706 desde un PC, ya os dirï¿½
algo al respecto. Espero noticias.

Dear friends I have one question and want you to help me. I
own a Icom 706 rig and two sticks for 20 and 40 meters. The
antennas are Valor Pro-am 3/8" conectors and they provide me
very good performance when used with a single magnet mount
on the roof of my 1990 Ford Fiesta car. The problem is that
I can not use it when moving the car because of the poor
catch of me magnet mount. I have tried several times to
mount the aerials in a hatchback mount, but performance and
SWR are very bad indeed. I donnot know how to improve it or
how to use it on the move. The aerials are almost 2 meters
long, half helicoidal half steel stick.
Also will be wellcome any mods, commnets, improvements or
anything about the ICOM 706 rig, how much power can it run,
etc.
Sorry for my English, thanks for your help.

Dear friends, i am very interested in buying or building a
mobile antenna for hf (20, 40 & 80 metres). please any
offers or ideas. could be exchanged for any material or
anything of your interest from my country. please also
offers on base verticals for hf.
I actually use a windom wire aerial about 41 metres long,
please tell ideas for improving the system. the fed point
with a 1:6 balum is about 9 meters high and the end points
about 3 meters high and i have about 2 or 2,5:1 swr in all
bands but work better on the warc bands (ï¿½?). It should be
working without the need of a tuner ATU, but I use it
always.....The long part is pointing East and the short one
is pointing West. Some people says that it has some
directivity through the long wire, but most says that the
directivity is perpendicular to the dipole. Any help on
this.

Hello friends:

My name is Francisco and I am located in Valencia, which is
a sunny and warm city in the East coast of Spain, in the
Mediterranean coast of the country. The Ham scene over here
is very interesting as you can find Hams almost every day in
the VHF band making FM or packet, and also a lot of friends
keen on HF.

This message is because I would like to get schemas, draws,
sizes and way of construction on antennas for HF (easy
vertical or wire ones, but also mobiles for 20 or 40
meters), so if you can help you can write by post to EA5VD
Francisco P.O.Box 123 E-46080 Valencia SPAIN, or by
E-mail, but please see if you can help.

As I have seen in the last days there is some activity on
Internet with Hams (most of them from the States), but it
will be of great help to know about WEBs of interest.

Write back soon !!!!!

Dear Friend,
Five minutes and five dollars can change your life!!!THIS IS THE FAIREST, MOST HONEST WAY I KNOW TO SHARE THE WEALTH! Would you like to make thousands of dollars, quickly, legally, with NOCATCH? Then keep reading..... please take five minutes to read thisarticle; it will change your life, just like it did mine. It's true! You can make up to, or over, $50,000.00 in 4 - 6 weeks; maybe sooner! I SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested, keep reading; if you're not, I apologize forwasting your time.

Here we go. A little while back, I was browsing through these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars in weeks, with only an initial investment of $5.00!! So, I thought, "Yeah, right, must be a scam", but, I was curious, like most of us are, and kept reading. Anyway, it said that you send $1.00 to each of the five names and addresses stated in the article. You then place your own name and address in the article at the bottom of the list at #5, and post the article in at least 200 newsgroups, (there are thousands). No catch, that was it! So after thinking it over, talking to a few people first, I tried it.I figured what have I got to lose except for 5 stamps, and $5.00, right? Well, guess what....within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But then money kept coming in , tripling in size and multipying by 10 - 20 times the amount that I got the first week! In my first week I made about 20 - 30 dollars. But, by the end of the second week, I had made a total of over $1000.00!!!! In the third week, I had over $10,000.00, and its still growing. This is my fourth week, and I've made about $42,000.00 TOTAL, and the money is still coming in.....Let me tell you how this works, and most importantly, WHY it works, also, make sure you print a copy of the article NOW, so you get the information off of it, and begin making money.The process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 separate pieces of paper and write the following on each sheet of paper...."PLEASE PUT ME ON YOUR MAILING LIST", and then write your NAME AND ADDRESS. Get five $1.00 bills and place ONE inside each piece of paper that you just wrote on. Fold each paper so the bill will not be seen in the envelope, (otherwise, nosey people who like to steal envelopes with money in it won't get yours). Put one paper inside each envelope, and seal it. Do the same for all five. You should now have 5 envelopes, sealed, EACH with a piece of

paper AND a $1.00 bill, stuffed inside of the paper. Make sure those words that were stated above, are written on each paper. What you are doing is creating a service; this is PERFECTLY LEGAL. Now then, mail the 5 envelopes, with the paper and $1.00 bill in each, to the following 5 addresses:

1. D. Ellis, 8301 W. 92nd St., Overland Park, KS 662122.

2. J. Krakowiak , 1112 W. Broadway #1, Anaheim, Ca 928053.

3. J. Sides, Lamar Box 1, South Plains College, 1401 S. College Ave.,Levelland, TX 79336

4. Areg Mkrian, 15 Alma Ave. Belmont, MA 02178-4404

5. A Karns, 4000 NW 53rd, Oklahoma City, OK, 73112

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up, (5 becoming 4, 4 becoming 3, etc.), and put YOURNAME as number 5 on the list. You can slightly alter this article ifyou need to; editing what you need to edit.

STEP 3: Post your amended article, (with your name at #5), to at least 200 newsgroups, (There are close to 19,000 of them). HOW TO DO THIS:If you are using Netscape 3.0, do EXACTLY the following:
1) Click on any newsgroup, like normal, THEN click on 'TO NEWS',which as on the far left when you're in the newsgroup page. This will bring up a box to type a message in.
2) Leave the newsgroup box like it is. CHANGE the subject box to something flashy, like, "NEED CASH $$$ READ HERE $$$" or "FAST CASH"!!
3) Tab once, and you should be ready to type. Now, re-type, (onlyonce), this WHOLE ARTICLE WORD FOR WORD, except to insert your name at#5, and to remove #1 off the list; plus any other small changes youthink you need to make. Keep most of it the same!!
4) When you're done typing the WHOLE article, click on FILE in THISBOX, right above send, not where it says Netscape News On The FirstBox. Click on SAVE AS when you're under FILE. Save your article as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS. Once saved, move on to number 5 below.
5) If you still have all of your text, send, or post, to this news group, now, by just clicking send; which is located below FILE, and right above Cc:.
6) Here's where you're going to post all 200. OK, click on any newsgroup, then click on 'TO NEWS', again, in the top left corner. Leave theNEWSGROUPS BOX alone. Again, put a flashy subject title in the SUBJECT BOX. Hit TAB once you're in the body of the message, and then click on ATTACHMENTS, which is below the SUBJECT BOX. You will get another box to come up. Click on ATTACH FILE, then find YOUR file that you saved; click once on the file, and then click 'OPEN'. Now click on OK. If you did this right, you should be able to see your file name in the attachments box, and it will be shaded green.If you use IE EXPLORER, it's just as easy......HOLDING DOWN THE LEFT BUTTON,

HIGHLIGHT THIS ARTICLE. THEN PRINT THIS ARTICLE FOR YOURRECORDS TO HAVE THE NAMES OF THOSE YOU WILL BE SENDING $1.00 TO. NEXT, GO TO THE NEWSGROUPS AND PRESS "POST AN ARTICLE". A WINDOWWILL OPEN. TYPE YOUR HEADLINE IN THE SUBJECT AREA AND THEN CLICK INTHE LARGE WINDOW BELOW. PRESS "CRTL" AND THEN "V", AND THE ARTICLE WILLBE PLACED IN THE WINDOW. IF YOU WANT TO EDIT THE ARTICLE, DO SO, AND THEN HIGHLIGHT AND COPY IT AGAIN. NOW EVERY TIME YOU POST THE ARTICLE IN A NEWNEWSGROUP, ALL YOU HAVE TO DO IS REPEAT "CRTL" AND "V" AND PRESS POST.
7) That's it. Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 different newsgroups. You see? Now you just have 199 to go!!! (Don't worry, eac hone takesabout 30 seconds; once you get used to it). REMEMBER ..200 IS THE MINIMUM. The more you post, the more money you'll make.AND THAT'S IT!!!! THOSE ARE THE ONLY 3 STEPS THERE ARE!!! You are now in the mail order business, and will start receiving $1.00 envelopes from various people, all over the world, within days.(HINT: THE MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILLMAKE!). You may want to rent a PO Box, eventually, because of all the mail. If you wish to stay anonymous, you can come up with a name, suchas "manager" or"investor". Just make sure all the addresses are CORRECT, please! LET ME TELL YOU WHY THIS SYSTEMS WORKS!! Out of every 200 postings, let's say I ONLY receive 5 replies, (this is actually VERY LOW). So, I made $5.00 with my name at #5. Now then,each person who just sent me $1.00 makes, say, only 200 postings, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. 50 people send you $1.00 now; that's $50.00 you just made! Now then, your new 50 agents post 200 each with YOUR NAME AT NUMBER 3, or10,000 postings, (50 X 200). Average return is 500 at $1.00 each, which is $500.00! They make 200 postings, which is 5000 returns at $1.00 each,which is $5000.00!! And finally, 5000 people make 200 postings each,with YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000.00 BEFOREYOUR NAME DROPS OFF THE LIST!! AND THAT'S IF EVERYONE MAKES ONLY 200 POSTINGS, AND IF ONLY A SMALL % PEOPLE RESPOND!!!When your name is no longer on the list, you just take the latest posting that is appearing in the newsgroups, and SEND OUT ANOTHER $5.00 to THE NAMES ON THE LIST, PUTTING YOUR NAME AT #5 AGAIN, AND START POSTING AGAIN!! The thing to remember is, do you realize that THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND ARE READING THESE ARTICLES EVERY DAY!! JUST LIKE YOU ARE RIGHT NOW!!! So, can you afford $5.00 and see if it really works? I think so.......People have said, "What if the plan is played out and no one sends you the money?" So what! What are the chances of that happening when there are TONS OF NEW, HONEST USERS AND NEW, HONEST PEOPLE joining theInternet and Newsgroups everyday? and, are willing to give it a try? Estimates are at 20,000 to 50,000 new users, each and every day!! Remember, play FAIRLY and HONESTLY and this WILL WORK, I PROMISE YOU!! You just have to behonest. Make sure you print this article out, RIGHT NOW, also, try to keep a list of everyone that sends you money, and always keep an eye on the newsgroups to make sure everyone is playing fairly. REMEMBER: HONESTY IS THE BEST POLICY!!

YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY! GOOD LUCK TO ALL, AND PLEASE, PLAY FAIRLY; YOU WILL REAP THE HUGE REWARDS FROM THIS.....WHICH IS TONS OF CASH!!! ****By the way, if you try to deceive people by posting the messages with your name on the list, and by not sending the money to the people already on the list, you will not get much. Someone I talked to knew someone who did that, and he only made $150.00; and that was after seven or eight weeks!! Then, he sent the 5 $1.00 bills; people addedhim to their lists, and in 4 - 5 weeks, he had over $10,000.00. THIS IS THE FAIREST, AND MOST HONEST, WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT OUR TIME! GOOD LUCK, AND HAVE FUN!!!!

2120. NEC C2221 transistor

Leaving aside the question of what happened next, please can someone explain why the designers of those amplifiers chose to lift the grids above chassis ground in order to insert the Ig meter?

Is there some hidden advantage, or some hidden problem in rearranging the B- circuit to meter grid current with the grids nailed firmly to RF/DC ground? Or was it just the "follow-my-leader" effect?

Dave.

If you have a W.W.GRAINGER warehouse or other electrial equipment sales company around your location they should have a GREENLY 3/4" chassis punch avaiable..

Hope this helps

Your problem is possibly the poor ground. The hatch may be metal
but might not be well grounded to the roof of the car. What you need to
do is bond the antenna ground at the mount firmly to the chassis of the
car. Don't ground the hatch if it is used for the car radio aerial....
otherwise ground it. Use the shortest possible connection and heavy
guage wire.

Alternatively, there are magnetic mounts available with sufficient power
to hold the aerial. You still need a good ground.

Perhaps by doing it that way you measure the current in each grid and
can bias each individually while using only 1 heater transformer?

Hi,

I have a dual 5 volt 33 amp dc pwr supply that I want to know more about. Do high power switching supplies usually have an output overvoltage protection circuit? What happens if the switcher transistor shorts? Do they have a crowbar type overvoltage protection? This one is made by a British company called Advance.

Tnx,

B

I show 30 9th graders ham radio every year on the air, they also see the
ARRL self serving video tape and I talk about the hobby spewing the
company line.
And you are doing just what?

> There are many of us out here trying to put

There may be "many" as you say but overall these many are a very small
percentage.

According to the method whereby Eimacï¿½ calculates operating tank Q in *Care and Feeding...*, Q is equal to 2000 ohms divided by the reactance of 10pF at 250MHz., =2000/63.66.
Hence, Q=31.

Source record: 96979

Actually, you can successfully parallel regulator IC's, as outlined in
such application notes as National Semi's Linear Handbook #1, page
1-69. You have to install .2 (!) ohm ballast resistors in the output
legs of each parallelled regulator to prevent one device from "hogging"
all the current. Several years ago we at LANL discovered this to be a
much superior method of getting increased current output to the more
common practice of using 2 or 3 LM195 power transistors in parallel in
the output circuitry. The output transistors turn out to be VERY
sensitive to capacitive coupling between devices, etc, and prone to
oscillation under certain load currents where the parallelled regulators
themselves were much more stable.

All:

If anyone is interested I'm looking into developing information about how to program Yaesu radios. I'm especially interested in learning about the FT51R and the FT8500. I want to develope C code that will allow me to program these radios on different platforms. If anyone is interested in this please let me know. Or if you have information to share please let me know.

I wanted to start this last year, but I started some serious course work
in college so this project suffered as did a few others.

ROTFLVVL Steve !! I can't WAIT to see what this is all about!
Will they list this "Burtie's Special Event Station" in QST
as "Celebrating 5 years of obnoxiousness and Stupidity from Cape Cod?"

Maybe they could issue a special QSL. Any suggestions?

Hi,

If you supply me with the exact spacing, the diameter of the
rotor and the total number of plates, I will calculate the
values with my handy dandy soon to be released program.

Well, you're on the right track. The numbers ARE the tube types; (27 and 37 very common for receiving, 45s for transmitting)

Source record: 96992

The LM prefix is for National Semiconductor devices. I don't know if
they make it. The MC3361 is the original, I'm pretty certain. It's
from Motorola. They do have a website, though I don't happen to have
the URL. Use Yahoo.com with "Motorola" as the search word. Or
contact Motorola directly and ask them for the data sheet.

USA:
Motorola Literature Distribution
PO Box 20912
Phoenix, Arizona 85036

Europe:
Motorola Ltd.
European Literature Center
88 Tanners Drive
Blakelands
Milton Keynes
MK14 5BP, England

(I didn't know which country ".pl" refers to)

These addresses are taken from a 1990 data book, so there is always
the possibility that one or both of them have changed.

Nope, sorry Burt but I am not an ARRL type person. Those of us that work
with the young folks here show them **REAL*** ham radio and not the tripe
that is spouted by some on the news groups or on the HF bands in certain
places. But then I doubt that you would do any differant to lure the
young in as your posts show that you really only do the motions of trying
not put any heart into it. It is plain to see that your love is in the
commercial area. Yup, I was in the commercial area too, I guess if you
call being a chief engineer for a couple of radio stations commercial.
But that is a differant story....And only has enhanced my abilities and
enjoyment of ham radio.

enuff said. end of thread.

Fred Ke8tq

I may not always agree with what you say. But I will defend to the
death your right to say it.

Laws differ in different parts of the world. In the UK possession of an amateur tranceiver is legal whether the owner has an amateur license or not. Totally legal. In fact you can buy them over the counter with no questions asked. Using it is a different question.

The right of free speech comes as a bundle with the responsibility of free speech. Since you demonstrate little responsibility yourself it would appear that packet sysops are forced to take responsibility. The pity is that now you will have your electronic tantrums on the news groups. Perhaps if all of those on the news groups who were tired of your spamming were to flood your provider with complaints your provider would take the same action as the packet sysops. Then you could scream your complaints out on the beach.

To answer your as yet unasked question, Yes I would say the above to your face, I just would not fly across the country to do it.

There are a number of such designs in The ARRL UHF/Microwave Projects Manual, including the famous one by Chip Angle. All the gory mechanical details are shown in drawings and pictures.

2157. WTB: WESKIT Mdl BN-1 Transceiver (Western Radio)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-22 00:00:00 UTC
From: 3W8PE1B <willi6@erols.com>
Message-ID: <330F4C24.46BE@erols.com>
Source record: 96849
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.boatanchors,rec.antiques.radio+phono,rec.radio.amateur.homebrew,rec.radio.swap,rec.radio.amateur.equipment

Now that my KnightKit "Ocean Hopper" and Ameco AC-1 projects
are well underway, it's time for yet another DXpedition into
Nostalgialand.....

The BN-1 is one of a series of small, battery operated, tube radios
(transceivers and receivers) produced by Western Radio of Kearny, NE.
The BN-1 was aimed at the Novice (hence, the "N") and covered
80/40 Meters, was XTAL controlled, and was battery powered
(hence, the "B"). It was available as a BN-1K (kitform) and also
the BN-1A (improved circuitry). The normal small cabinet was
fiberboard material, although a metal case was available for $3.50!!!

The tube was a dual triode (3A5) that served as the XMTR and RCVR.

you started QRP with a single 45 Volt battery
and could work up to QRO with a couple of 90 Volt batteries.

They normally adversized with small (one colum inch) ads in the
back of Electronics Illustrated and Popular Electronics.
The Western Radio (WESKIT) line also included:

Allband Transceiver (BAB-1)
Six Meter Xcvr (BA6-1)
Two Meter Xcvr (BA2-1)
Citizens Band (C27B)
All Band Receiver (BR-1)

If all this nostalgia peaks your interest, Sheldon Wheaton,
KC 0 CW, has a BN-1 illustrated on his web site at:

http://www.sky.net/~swheaton/bn1.html

[[Thanks, Sheldon!]] :-)

I had one of these as a kit (isn't that always the story); but,
traded it to a local radio shop for a batch of SWL books,
(Actually a good deal at the time - before nostalgia set in!)

If you have one of this cute little rigs you'd like to part
with, drop me an E-Mail at: willi6@erols.com

Necesito saber como calcular donde van las tomas para las bandas de 15-20-40
y 80 metros, en la bobina tanque (salida) de un amplificador lineal que
utiliza 4 v=E1lvulas 811A.
La bobina consta de dos secciones: una de 4 y 1/2 espiras N=BA 10, 1 1/2 "=
de
di=E1metro y 1 y 1/2" longitud (banda de 10 metros) y luego 13 espiras N=BA=
12
con 2 1/2" di=E1metro y 2" longitud, donde deben ir las tomas para las=
bandas
de 15-20-40 y 80 metros.
Si alguien puede indicarme donde se deben poner las tomas para estas bandas,
favor contactarme.
Saludos.

I think what everybody misses is a point I saw in Popular Communications a
few months ago./

If you're going to use your vhf/uhf rig out of band, e.g. in the marine
band,
have a marine license, even though it isn't type accepted, who's going to
ask which radio you're operating. SAme for gmrs, or other services. If
youy're licensed to use the service, even though your radio isn't type
accepted, you can operate out of band and get away with it. It's kind of
a "DOn't ask, don't tell thing."

Probably because they expect any competent reader to understand
operator precedence in standard equation notation. Multiplication
has a higher precedence than addition, so the parentheses are
unneeded. That is, they are unneeded unless you are algebraically
illiterate and fail to understand AC Circuit Analysis.

Tell us, Rich, how did you separate the external anode to grid ring structure capacitance from the internal anode to grid wire capacitance in your measurements?

No one is doubting that total output capacitance for the tube is 10 pf. The question of interest is how much of it is attributable to the grid wires? They are rather small diameter, so they wouldn't be expected to make very good capacitor plates. Perhaps you can reassemble one of your disassembled 8877s leaving the grid wires out and measure the capacitance of that. The difference should be the capacitance attributable to the grid wires.

If you are right, there will be virtually no capacitance left with the grid wires removed. If Tom is right, the change will only be about 0.1 pf with the grid wires removed. Simply looking at the tube outline drawings, it is apparent that there should be some capacitance between the external anode and external grid ring. The geometry makes it a bit hard to calculate what that would be using a simple two plate formula, but it appears to be more than negligible. You have what is needed to settle this. Make the measurement without grid wires and get back to us.

I have a large assortment of like new boards, modules, 1/8" flexible hard
line with SMA connectors on both ends, BNC chassis connectors, various interconnecting cables,etc.

The many boards contain such things as SAWTEK SAW filters of various bandwidths, transitors, IC's, miniture relays, torriods, trimmer capacitors,
filters, modules, etc.

I am selling as a "grab box". If you are a builder, this is a gold mine of
goodies.

I will sell the above for $50 plus $10 shiping.

I also have one have one Hewlett Packard 33314A coaxial switch left. DC to 4 GHz. Will sell for $45 shipped UPS.

One Amplica broad band pre amplifier which works from 1 to 3 GHz perhaps even lower and higher. I only checked it in that range. Letting it go for $25 shipped UPS.

Actually what I said is NONE of us have any idea how that capacitance is distributed, All ten pF absolutely is not between the grid wires and the anode, and Rich certainly would have no idea how the capacitance is distributed from the perspective of his test bench, even if he uses his sophisticated Q measuring dip meter.

I do have data published by Eimac that indicates the actual grid capacitance is quite low, but the output capacitance is much higher.

In any event, it makes no difference for two reasons:

1.) If Measures is correct, he has just proven that parasitics can't damage the grid. After all, if 41 amperes of displacement induced current won't hurt the grid in continuious operation it is impossible for one of Measure's pathologiocal parasitic oscillations to wipe out that extremely tough grid in a wink of an eye,

2.] If Measures is correct, then the desired operating frequencies drive power can't ever hurt the grid either. So we need no grid protection at all.

Of course this all begs us to explain why Eimac recomments a grid overload system that removes drive with excess grid current, and why they rate Mr. Measures 41 ampere grids at 25 watts dissipation in the 8877, and less than 5 watts in the 3CX800.

The whole 41 ampere argument is placed against the entire world, and even reputes Measure's own claims a "sudden burst of VHF energy can damage the grid".

Burt

>Hello Burt,
> I just wanted to drop you a note concerning the thread currently running
on the rec.radio.amateur.equipment newsgroup. After ready the many
replies,
flames, etc, I would have to agree with *some* of your comments and
thoughts. I think you have a picture in your minds-eye of the "typical"
ham
operator being a rag-chewing, cigar smoking, foul-mouthed,
over-glorified
CB'er. Though there are MANY that fit that bill, but, I think better
than
half don't fit that desciption. As I'm sure you know, there are many of
us
who do public service such as Skywarn, RACES, ARES, etc. To group those
of
us who do public service with the lids is an unfair condemnation. I
literally put myself at risk when I go out and spot for the weather
service
and don't look at myself as being involved with a hobby at that point,
but
rather, an important part of a system that can and does save lives.
> After looking over your website, following the thread for the past few
days, and reflecting on the garbage I hear on some of the bands, I can't
argue with a good portion of your comments. Many of the respondants have
been very articulate, others have shown that they think with their
southern-most body part. I believe you are a person who is truly
concerned
about the state of Amateur Radio and it's related services. Your
opinions
may not neccessarily be within the mainstream of the hobby, but they do
count, and I respect that. I hope that you can also respect the efforts
of
those of us who DO look at Amateur Radio as a way to help others, and
show
that by doing the service work. We are not all lids, and I hope you can
see

that.
> I decided to send this note to you personally, rather than through the newsgroup, so as to try and get it back to the subject it is supposed to cover. I look forward to your reply, and your thoughts on my comments.

The 10 V/m and even 100 V/m susceptability requirements are essentially
meaningless. The field from a close HT easily exceeds this.

10,000 V/m would assure protection for safety-critical equipment such as
life support, 1000 V/m
for mission-critical equipment such as cash registers, and maybe 250 V/m
for other stuff would
be much more realistic.

I suspect you are a ham in the tradition of KV4FZ, that notorious personality of the (14.313 MHz) airwaves. Never the less, I would enjoy meeting you on the air sometime, say, on 20 Meter phone in the General class portion of the band. I know you are a cw buff but I think phone would give a bigger audience for you and allows others to make comments more readily. However, if hams are as gutless as you say, there should be few comments.

As far as the facts about Little Leo's are concerned, I am sure you are armed with all sorts of technical data about their compatibility with the existing uses in the bands. However, I would like to know where you got such data because everywhere I go says that such data does not exist.
This is not to say that such data would change my position. I am against any commercial intrusion into the amateur radio allocations, especially the ones that are being fully utilized such as the 2 M and 75 cm bands.

I look forward to your reply.

Sincerely,

Michael Goad

Actually, Burt, your news article has helped me to decide in favor of
sending the FCC an e-mail in SUPPORT of the ARRL's position and to
further encourage every ham I talk with to do the same. If you are so
against amateur radio and all it is and does that you are willing to let
the commercial interests come in and take over (you know they won't be
"shared" for long) two of the most utilized bands we have, why don't you
turn in your license and get out of ham radio all together.

If you believe that protecting the interest of amateur radio is not in
the best interest of the general public, perhaps you should come down
and
talk to some of the victims and rescuers involved in the aftermath of
hurricane Andrew in Dade County, FL. Amateur radio's ability to be used

in times of disaster is highly dependent on the bands the little leo's want. We cannot allow any intrusion on these bands if we are to be useful
to the public in times of emergency.

For the record, I am a communications technician for the fire-rescue department of a local county, so I do have some first hand knowledge of the events following hurricane Andrew and the utilization of amateur radio there prior to the arrival of outside help from FEMA and others. Because of its usefulness, there has been a greater effort by the local governments in south Florida to work with the amateur radio community to ensure that this service will be available in the future. Many agencies now have amateur radio stations in key facilities and have lined up operators to run them in emergencies. Some have provided learning materials for their own personnel who expressed interest in becoming ham radio operators.

I am not sure what your motivation is in backing the little leo's, but I suspect it is financial. What we are talking about here goes way beyond the almighty dollar in my book. I am here to let you and all who read this that we will fight this to the end.

Sincerely,

Michael Goad

> be few comments.

In actuality, Burt has been invited numerous times to a moderated roundtable type forum on the band and frequency of his choosing. Each time, he is, what is referred to as a no show, thus proving the saying that those who talk the talk (the gut vs gutless scenario) don;t necessarily walk the walk

Look for the Burt special event station to be setup VERY near his home sometime around the end of March. The amateurs of Cape Cod and surrounding areas will be invited to attend this. One special feature will be to show Burt in his true environment. Hopefully, Burt will make an appearance and even work some stations (after all, we will be parked in his neighborhood) We (and there is going to be more than one) will be connected to the Internet and will be demonstrating the public minded Burt to all his neighbors

More details as time progresses

Your suspicions are wrong.
Fight all you want, it is ATYPICAL of a ham to fight for ANYTHING.

I will appear on 20 meter voice and you can gather a crowd as I doubt
you can talk to me without a fan club for support. Hams are as gutless
as I say. If there are comments there will be no calls attached to them.

Total bullshit. Tommorow is Sunday let us have a go at it.
I can go on almost ANY band.
Why don't you cite ANY time a ham has accepted my challenge, they always have an excuse, (my rig is packed away, the antenna is down, or just no reply).

I already told a local ham of your offer. If I am invited I will come.
The local hams despise me more than you do but they have zero guts.

You know I do not hide, you can see AND hear me on my WWW page, can you say the same for any others around here?

Jan and everybody else who has made their own coils:

Can you suggest a good, inexspensive reference for winding coils? I have seen many neat schema that require "twisting yer own" but have never found easy-to understand instructions.... Please don't direct me to the ARRL handbook! I have gotten them from the library and they seem more geared toward someone who:

A. Has a ton of time
B. A ton of money
C. Wants to buy _their_ kits!

(asbestos shorts are now on....)

Thank you kindly.

As a former California firefighter I feel qualified in respectfully
saying that kr4wm's comments below are just horse poop.

kr4wm@sccoast.net wrote

>I am a career firefighter. I work in a <paid> department, and do it for a
>living. I'm not some yahoo volunteer out to make a name for myself by
>doing stupid things.

Save the rivalry for the FIRE-L newsgroup; you know full well that over
75% of our nation's firefighters are volunteer/paid-call. I won't allow
you to degrade over 3/4 of our country's firemen.

>When I got my amateur license, it was then that I found out that
>certain ham radios could be modified to work out-of-band. At the time,
>our department was stiffed for funds, and occasionally, some of us would
>be inside a burning building with no way to communicate with the outside
>(lack of radios).

No excuse for using a 2m HT. Daily I see very good prices on Motorola
HTs on rec.radio.swap; just last week someone had 100 Mot HTs for
VHF-hi going for $25 each (see below). And resellers such as Tele-Path
have excellent prices on used gear, too. Once single fund-raiser would
have earned your department enough money to go the legal route.

Here's an example from rec.radio.swap:

Subject: Re: Motorola walkie-talkies for sale: $25.00 each
Newsgroups: rec.radio.swap
Radioshop@aol.com wrote:
>Quantity available 30: Motorola HT-220, 1 channel, 4 watt, $25.00 each.

What's your department's class rating? It must be very bad (which trans-
lates to expensive fire insurance for your community's residents) if
your comms are lacking as you say.

>It was a godsend that I obtained permission from our
>department's chief to use my amateur HT and mobile to transmit on the
>fire department frequencies!

Did you explain to him you were endangering your department's license?
Did you explain to him that modified amateur equipment might interfere
with other services and thus possibly endanger lives?
Did you explain to him that your amateur HT is not built to commercial
standards and might fail due to the heat of fire?
Did you explain to him that your HT is frequency agile and a slight

bump during firefighting might result in a change of frequency?

Regarding these last to points, having an HT gives one more of a
sense of security during a fire and thus, you might place yourself
further "into it" than if you didn't have the radio. Failure due
to heat or freq'y change have now placed you in greater danger
than if you didn't have any HT at all (you probably wouldn't have
gone as deeply into the structure).

The fire radio service was created for you and your department's safety.
Very high standards (e.g. NFPA) are set for comm gear; don't endanger
yourself and those depending upon you by being so thrifty/lazy.

> I've
>also used my mobile rig when I was off-duty to call the F.D. Dispatcher
>and inform them of auto accidents that may have gone unreported for long
>periods of time.

Still no justification for not going the legal route. The proper gear is
out there and a very reasonable price.

>Or to let them know that no emergency response was
>necessary, saving the wear and tear on our engines. At $700 per run, it
>adds up. Yes, all things considered, it costs about $700 to put a fire
>truck in the street for EACH CALL!

The your department needs a new fiscal officer. Even if you include
depreciation, fuel, engine and pump wear, et cetera, it should be
far below $700/run. Please document how you arrived at that figure
(and don't include FF salaries - that's a cost to the department
regardless of the number of runs).

> 73, Web Williams, KR4WM, City of Myrtle Beach Fire
>Department, Myrtle Beach, SC

73,
Jeff KH2PZ (former Fireman II for City of San Clemente, and Calif.
Division of Forestry)

P.S. I'd say it's about time to petition manufacturers to design
amateur-only radios; the major benefit would be better performance.

<burtfisher@geocities.com> wrote:

>It takes guts to kiss ass?
>Thatr is what hams are experts at.

Burt,

You call yourself a teacher? A mentor entrusted to help shape the minds of our young children? Heaven forbid, a roll model? By your posts you have proven that you are incredibly opinionated, not above using foul language in an open forum of mutual learning that is easily accesable by curious young minds, you point your "holier-than-thou" finger at Amateur Radio Operators and seem to have no problem speaking ill-will of this group of human beings. Can you tell me just what exactly it is that makes you a better person than any of these people you speak so poorly of? I am an Amateur Radio Operator myself and I take great pride in it, I also pride myself on being a volunteer interpreter for the deaf, a volunteer for the American Legion, an advocate for the rights of Veterans and the disabled, among other similar interests. I literally volunteer more of my time than I work for a wage, I may be poor but if pride were gold I'm a very rich man.. Can you say that, Burt?

This is America, Burt, and you are by the first ammendment entitled to voice your opinion, but you already know that. I too am an American and am entitled to my opinions and my opinion is that you are a bigot and have no business in the teaching profession if you are incapable of treating other human beings as the equals that they are. In the mean time, I'll be praying for your students..

If you have such a problem with Hams, why not (on the way to church next Sunday) rip up your FCC license into little pieces and go about helping your fellow man in a manner more constructive than the one you have chosen.

John KB7VZL (and darn proud of it)

2200. PA lowpass filters as matching networks

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-22 00:00:00 UTC
From: rohrwerk@pcOnline.com
Message-ID: <rohrwerk-2202971421560001@tsa-p2.pconline.com>
Source record: 96892

A couple of things came together in my recent upgrades to my portable 40/20 meter rig. Its final is based on W1FB's notebooks -- the 5-watt nominal broadband final with a feedback winding through the output transformer. I was using an NTE236 transistor -- rated at 12 watts output in SSB service up to 50 MHz -- and I had lots of problems getting more than 3.5 watts output on 20 meters, when I could easily get 9 watts on 40. Now of course these amps won't be totally flat even with feedback, but I thought this was not too good, so I proceeded to dig deeper.

Surprise! Even a hefty driving power (up to 1 watt!) did not push that durned transistor beyond 3.5 watts! The original driver was a 2N3866 with feedback... the new one was a 2N3553 with hefty idling current (from "Solid State Design...") which would go to about a watt if you weren't concerned about perfect linearity.

Well, the big thing I had forgotten was a capacitor at the transistor output to suppress those little VHF parasitics! Sure enough, 200 pF let me soar right up to 9 watts at 20 meters with the hefty driver.

This was fine when watching the unfiltered output on my scope into a dummy load. But... now why the heck am I back down to 4 watts when I put that durned lowpass filter back in, I thought? (40 meters was still an FB 9+ watts max...)

After some more headscratching, it dawned on me that all impedance matching with a broadband transformer is an approximation .. and I also surmised that impedances might remotely be different at different frequencies... and I remember Wayne Burdick mentioning how folks got tons more output in their Sierras by squeezing/stretching the turns on their output toroids (Dec. 1994 QRPp...)

So, fiddling with the lowpass filter finally maximized the output!
It was a five-element lowpass filter with 2 coils, and adding a turn to the input coil and removing a turn from the output coil let me get finally a full 9+ watts on 20! How did I figure which direction to go? Squeeze the turns and see where the power went. If you squeeze the turns on the toroid and the power goes up, you need more inductance. If you spread 'em, and the power goes up, you need less. And verse visa -- er, vice versa...

Lacking instruments and energy to make full impedance measurements, from the evidence above I conclude that the actual PA impedance at 20 meters is somewhat higher than 50 ohms, since a lot of older projects in QRP Classics or such use lowpass filters as matching networks, usually with lower inductance/higher C on the input (less than 50 ohms to match the collector) and higher inductance/lower C on the output (50 ohms)

The moral of the story: a little fine tuning could go a long way toward improving your output and/or efficiency, especially on the higher bands. Just because your kit doesn't provide trimmers on the output networks, don't assume that you can't goose that little final for a bit more.

If you want ANY licensed amateur's address and phone number, do a search for QRZ on the web. Once there, you can input the callsign, and instantly get the info you want. Beware, that sometimes weird people use others' callsigns. Please be careful not to flame an innocent bystander in the process.

Good luck, and please think before you act harshly. The net is fun, and some people just are 'that way'.

How can an arc welder melt 1 inch plate steel yet not melt the 1/8th inch diameter steel electrode where it clamps to the welding handpiece? The current flow is the same both places. In fact the current flow is also the same where the cheesy aluminum ground return clamp is attached to the plate steel, but it doesn't even get warm. Kirchhoff's law demands current be the same through every part of the loop.

In any current loop, power dissipation is greatest at the point of greatest resistance to current flow, IE the point of greatest I^2R. The points where electric current has to break free of a surface, or rejoin a surface, are the points of greatest resistance in the cases of the arc welder or a vacuum tube, because of the electron work function of the materials, so dissipation is greatest at element surfaces where they liberate or accept electrons. Thus the plating of such a surface will receive the bulk of the heating.

You see the same thing with boiling water. It takes 7.5 times as much energy to vaporize water as it takes to raise the liquid temperature from 0 C to 100 C. The reason is that Van der Waals forces must be overcome to liberate water vapor. For electric circuits, the corresponding factor is the electron work function of the material. That is exactly equivalent to more mundane electric resistance in regard to current flow.

Note that there is also a "superheat" factor due to acceleration of the electrons in a potential field. This adds a kinetic component to the energy delivered at the target in the same way as superheating steam adds to the pressure delivered to the turbine. This "superheat" factor can be dominant, such as in anode heating of a power tube, or it can be minor, as in the case of the AC arc welder (and I would suggest also in the case of control grid heating of electron tubes, because the accelerating potential is small between cathode and grid, and the distance over which it can act is short).

A 6 kW arc welder and a 6 kW electric resistance heater both consume the same amount of power. In the former case, the power is dissipated

in a concentrated area and melts steel. In the latter case, the same power merely generates a warm glow. You're trying to treat the grid as a resistance heater when it is more like an arc welder in that the bulk of the heating occurs at the surface boundary where the electron work function (and any "superheat") dominates over bulk resistive effects.

In other words, the electron flux in a vacuum tube is the same as the electron flux in an electric welder's arc. The only differences are that typically our amateur power level tubes have a lower electron flux, and the materials with which the flux interacts are much less massive than the large steel plates on which a welder acts. Just as the welder doesn't have to heat the entire mass of the steel plate to the melting point in order to weld, the electron flux in the tube doesn't have to heat the entire mass of a grid wire to melt the gold plating.

Assuming a 20 microinch plating of gold, there are approximately 14.4 micrograms of gold on a grid wire. How much heat do you think it takes to melt 14.4 micrograms of gold? I'd suggest a 100 watt heat flux is more than sufficient when concentrated on that plating.

You do it just as you suggest, by changing the crystal and retuning
the multiplier and amplifier stages. If you want a bit of frequency
agility, you'll make the oscillator a VXO by adding a trimmer capacitor
across the crystal. Depending on the multiplication factor, you may
be able to achieve a 50 kHz tuning span. If the oscillator uses an
overtone crystal directly on frequency, tuning range will be less,
perhaps less than 10 kHz.

>series circuit and can't agree with that approach. I also don't like
>the fact that the operating Q appears to be 75!! That alone makes me
>think my approach might be wrong.

Well, I certainly cannot agree that the grid current is equal to the
tank current. That implies that the grid-plate capacitance is the only
capacitance in the tank circuit. (So what are those bread slicers
doing out there?) This is obviously false. The tube output capacitance,
a portion of which may be attributed to grid-plate capacitance, is in
parallel with the plate tune capacitor. Any circulating tank currents
are shared between the two capacitances in direct ratio to their
cpacitances, IE the larger capacitance hogs the current. Thus the

current in the grid-plate capacitance cannot equal tank circulating current.

Now Tom offered a bit more information. The bulk of the 10 pf Rich is using is not capacitance between the grid wires and the plate. So the grid wires don't have to carry even the portion of the tank circulating current assignable to tube output capacitance. Tom offered that the actual capacitance attributable to the grid structure is on the order of 0.1 pf. That immediately looks much better. That's an impedance of about 6633 ohms, and is shunted by the impedance of the plate tune capacitor, and by the 9.9 pf of tube output capacitance attributable to such things as capacitances between the external anode structure and the external grid ring or the chassis. So the amount of circulating tank current the grid wires have to carry is much less than the 41 amps Rich calculated.

As a first approximation, the grid wires are carrying 0.1/9.9 of the current attributable to the tube output capacitance. And that's further reduced from the total circulating tank current by the ratio of the tube output capacitance to the plate tune capacitor capacitance. So the grid wires are carrying a very small fraction of the 41 amps Rich calculated.

>Gary, if I'm wrong about my analysis I'll be happy to admit my
>mistake. But I think I'm right which, God help us all, means Rich was
>right about the RF current. Not the implications of the current, just
>the current.

Well, I must say my series circuit explanation was flawed. It looked only at currents attributable to the tube dynamic resistance. I neglected to consider the much larger tank circulating current. For that mesh, the grid-plate capacitance is in shunt, not series. Fortunately for us, the shunting capacitances are much larger than the grid-plate capacitance.

Common sense tells us that wires the gauge of the grid wires in an 8877 can't carry 41 amps. Common sense is right, it just took a bit of thrashing to find out why the wires *aren't* carrying 41 amps.

No problem. I've been there and done that with regard to magmounting antennas for the IC-706. You need one of the heavy duty multiple magnet mounts if you want the antenna to stay on the car in motion. I've used one with 4 magnets and it does stay on the roof. You have to bond the coax shield to the body somewhere nearby, however, because the magnount doesn't have enough capacitance to the body at HF to form an effective counterpoise connection. I used a short piece of braid over to a roof rack screw.

This may also the be bulk of your problem in trying to get the hatch mount to work. You have to have a good electrical bond to the bulk of the car body. You're probably attempting to resonate your coax without realizing it.

There is another problem with mobile in motion for other than a true rooftop mounting. That's the detuning effect of the whip's motion with respect to the body. That can make SWR vary wildly as you drive along. All I can offer in that regard is to guy the mast to prevent such whipping. (This is mostly a problem with bumper mounted antennas, but it can come into play with any body mount. A pure center of rooftop mount is least affected by wind whipping, but even it will show some detuning effect.)

Now on to the subject of the IC-706. Respect the 100 watt output limit. It is a small radio, and souping it up will run into heat dissipation problems. Most of my operation is key down digital operation, and for that I recomend reducing power to 50 watts.

Other than removing the diode to open up HF transmit, I don't know of any HF mods for this radio (and unless you want to drive a wideband transverter, there's no reason to perform that mod, this is not a CB).

There are some worthwhile VHF receiving mods for the radio. The general coverage VHF receive filter can be changed by changing two capacitor values so that you can *actually* have some sensitivity above the 2m band. (You could also cut the yellow wire, but that doesn't work nearly as well.) I don't know of any worthwhile out of band transmit mods for the radio (and would discourage use of such a mod if I knew of one since transmitting out of band is generally illegal).

The radio's preamp is mostly an IMD generator, and I recomend that you leave it off as much as possible. The noise blanker is also pretty pathetic because the noise amp is tapped off too late in the receiver's selectivity chain. That makes it more of a distortion generator rather than a noise blanker. Both of these areas need redesign. I think I know how to fix the noise blanker problem, but I haven't gotten around to doing it. The preamp circuit simply needs to be replaced by a more robust design.

Another caution. Don't operate VHF and HF antennas close to each other on the vehicle. Several people have reported blowing the TR diode in the VHF side by transmitting on HF from an antenna tightly coupled to the VHF antenna. Try to keep them at least 5 feet apart (or more if you can), or use a diplexer with adequate isolation. The problem here is that the VHF output network is a pure lowpass filter, and happily passes the HF energy into the VHF front end. That's only designed to handle 10 watts, and the 100 watt signal can pop the TR diode. (Icom suggests using a heavier diode here if you experience this problem.)

I love this little radio, and it is lots of fun to use mobile, but it isn't perfect (what is?).

Well, think about it this way. If there is a shunt capacitor bolted directly from anode to ground, the capacitance required to resonate the anode decreases by that amount. And if that shunt capacitor is the dominant reactance (64 Ohms) then we have to resonate it. That means the tuning network must present to the anode a shunt impedance of 4.5k resistance in parallel with +J64. Out tuning capacitor becomes a tuning inductor. If we make tuning reactance lower, say +60 then we can make a plate tuning cap work by making the total capacitve reactance to ground -60. That's the only way it'll work Remember, Gary, we've used a hypothetical here at 250 MHz where things are a bit lopsided.

>The tube output capacitance is in
>parallel with the plate tune capacitor. Any circulating tank currents
>are shared between the two capacitances in direct ratio to their
>cpacitances, IE the larger capacitance hogs the current. Thus the

IFF we have a plate tuning capacitor. But as shown above, the reactance presented to the anode to resonate it must be inductive, not capacitive.

>Now Tom offered a bit more information. The bulk of the 10 pf Rich
>is using is not capacitance between the grid wires and the plate.
> is on the order of 0.1 pf. That immediately looks much better.

It looks better but it's wrong. Remember them finding that it was the grid-to-cathode capacitance that was .1 pf, not the grid-to-anode capacitance.

>So the grid wires are carrying a very
>small fraction of the 41 amps Rich calculated.

Not if the capacity is 10 pf, which it is. Again,
> Rich was
>right about the RF current. Not the implications of the current, just
>the current.

>Common sense tells us that wires the gauge of the grid wires in
>an 8877 can't carry 41 amps.

That was the problem I had a first. But, remember, the RF current--unlike the DC grid current--causes losses only in the DC resistance of the grid structure. There are lots of wires (to get a u of 200). And, using my 5CX1500B example, you can see that a similarly rated suppressor grid can carries half that current at 100 MHz in service throught the world.

Now, is it practical to build a 3CX1500A7 amp at 250 MHz and have it work? The data sheets suggest that it is. I don't know whether anyone ever has.

All my mentors tell me my analysis is right. I trust Tom's judgement in these matters. Let's let him opine on the subject. Or Ian; he always has a good analytical approach. Or we can submit to binding arbitration. At this moment I would characterize my position on this RF current question as adamantine.

So, are you saying 250 volts is the peak voltage? Your chances of making sense are fading fast. (I now know what Fred was *trying* to say, but he *did* say a plate voltage of 250.) I don't have a bit of trouble distinguishing between peak and rms values. But they are related by the square root of 2 only for pure sinewaves. In the case of a tube conducting for less than 360 degrees, IE other than Class A operation, that relationship doesn't exist for currents flowing in its elements.

> Hence, Q=31.

Eimac says (pg 35) that for a pi output network matching to 50 ohms, Q = C1*pi*f*Rl, where C1 is the plate tuning capacitor (including tube output capacitance), f is frequency in Hz, and Rl is the plate impedance. That equates to Q = Rl/Xc1 as you are using it, but you are assuming that the tube output capacitance is the total plate tuning capacitance. That's seriously poor design. So using that formula for that tube at that frequency is misleading at best. A different output network topology would be used for an 8877 in a 250 MHz amplifier so that a realistic loaded Q of 10 to 15 could be achieved. And that would yield a different formula for loaded Q.

Note too that Fred's Q of 75 is approximately right for a legal limit amp with a 4 kV plate supply and a pi output circuit with a C1 of 10 pf because Rl is 4685 ohms in that case, not 2000 as you are using. You wouldn't want to design an illegal amp would you?

All of this is moot in any event because your fundamental assumption that the capacitance between the grid wires and the anode is 10 pf is incorrect. 10 pf is *total* tube output capacitance, and the bulk of that is between the external anode and the external grid ring/chassis.

This has gotten rather far afield from a realistic *HF* amplifier. C1 will be a real physical capacitor in shunt with the tube's output capacitance, so the tube's output capacitance won't be carrying the full tank circulating current anyway. And the output loaded Q will be designed to be a much more reasonable 10 to 15 so tank circulating currents will be much lower in the first place.

Gary

Yes, sure! There was a 220MHz design in the ARRL Handbook for some
years, and it can even be pushed to 432, with full legal-limit output.

>All my mentors tell me my analysis is right. I trust Tom's judgement
>in these matters. Let's let him opine on the subject. Or Ian; he
>always has a good analytical approach.

Maybe I know how to ask qusestions, but I'm a beginner with HF power
amps - which is precisely why I'm following this thread with some
interest. My personal experience starts above 30MHz.

Let me add (out of pure mischief) that a major problem with big VHF/UHF
power amplifiers is that they sometimes go bang without any warning.
This is usually blamed on *HF* parasitics!

Some aspects of this problem are reasonably well understood. It can
happen because a typical capacitively-coupled half-wave input/output
line tends towards an open-circuit at lower frequencies, so the tube is
almost completely unloaded; it also has higher gain.

If the amplifier goes roaring off into oscillation the very first time
it's switched on, or the very first time you hit an unusual combination
of operating conditions, that's fair enough. But what about the cases
where the amplifier works for tens or hundreds of hours, and then
suddenly goes bang? What's the trigger mechanism? Why did "the dog not
bark" until then?

I can answer that first hand Ian.

That method came from Bill Orr, when he tried to copy the system used
in the Collins 30S1 linear PA that used a 4CX1000A PA.

In the 30S1, the grounded screen offered isolation of the anode to
cathode path. That gave the designer freedom to use a high impedance
from the control grid to chassis and effectively tap the control grid
UP on the drive voltage (cathode).

The 30S1's 4CX1000 tube is rated at zero watts control grid
dissipation, and the high control grid impedance did three things.

First, it allowed the drive power to be more evenly distributed to the
screen and control grid.

Second, it created more negative feedback by radising the drivin
impedance of the tube.

Third, the control grid used the ratio of cathode to grid impedance
to grid to ground impedance as a divider. Since the tube was AB1 in
normal operation, grid cathode impedance was dominated by the
capacitance from grid to cathode as one half and grid to chassis
(through a fixed small value cap) as the other half.

If the grid ever drew current, the cathode to grid impedance dropped
like a rock and grid drive was reduced! Instant protection.

The requirements for this circuit to work are the tube must have additional elements that shield the control grid and cathode from the anode (the "floating" or partially floating control gid no longer shields the anode to catode feedback path) and the tube MUST be AB1 in normal operation.

Unfortunately someone tried to apply this to class AB2 triodes, breaking both design rules.

The result is incomplete shielding and a grid that moves all over the place through the RF cycle and other drive level and tuning changes.

That circuit (which Orr calls a super cathode driven circuit) does several bad things. It makes IMD more dependent on tuning, it destabilizes the PA, and it causes gain variation with frequency and grid current. An additional side effect is it allows any anode to grid arc to bias the grid very positive (to the full anode voltage) and couple the surge to the cathode. The surge can come right out the input of the PA and damage the exciter and other components (like the zener diode) in the filament circuit.

The whole system that was wonderful in the 30S1 becomes very unwise in a triode, and foolish in a AB2 triode PA. Grids belong well grounded in triode grounded grid PA's.

In the SB-220, the circuit also sets the PA up for VLF oscillations. The grid chokes become tuned and if the proper amount of filament impedance or anode impedance is presented the 220 can break into a VLF oscillation.

The Collins 30L1 triode is also prone to this (Collins even has a published mod to "detune" the grids), as is the Drake L4B.

The oscillations are repeatable, and I demonstrated to Heathkit they were a potential problem, but at that time I was starting out and Orr was more trusted....so the flawed grid circuit remained.

So you see, the chokes do many bad things, and should be removed and the grids solidly grounded for several good very reasons. Stability and performance improve when the grids are grounded.

Well, the idea of electrons originating from the anode is pretty strange in its own right, unless you're postulating truly incredible secondary emission from the anode. The cathode is the only bulk electron emitter in a properly functioning vacuum tube.

>Not everything Gary says makes sense to me, Fred. Gary does not seem to
>understand that apparent (AC) current is virtually identical to DC current
>even though no NET displacement of electrons takes place.

Even with AC circuits, it takes two wires to make a light as the old electricians say. There has to be a complete path for the AC currents just the same as there is for DC currents, unless you're postulating radiation as the mechanism for closing the circuit. The only practical difference between AC and DC current flow is that a capacitive reactance can couple AC displacement currents but not DC currents (and an inductance freely passes DC currents but opposes AC currents). That's not at issue. What is at issue is looking at the complete current mesh. Kirchhoff's laws cannot be ignored, whether AC or DC currents are used. The current in a mesh is inversely proportional to the *sum* of the resistances (impedances) around the loop. You can't just apply a potential to one end of a wire and expect current to flow. You have to have a closed current loop. Your grid current calculation ignores the other impedances in the loop, in particular the capacitances in shunt with the grid-plate capacitance.

[Fred said]

>> electrons (heat).
>
>The grid is pretty-much grounded, so its potential is virtually 0V. . The
>grid attracts electons when the cathode is driven negative---i.e., since
>like charges repel, electrons on a negative-potential cathode are repelled
>toward the 0V grid.

Well, because we *define* the grid as the common point in a grounded grid amplifier, it is *by definition* at zero potential. That's because potentials are measured relative to some point, and we've defined that

point to be the grid in this circuit. The potential of any point relative to *itself* is always exactly zero. "Ground" is not an absolute, it is always a matter of convention as to what we call "ground", and it only has meaning relative to some other point.

But zero is a more positive number than any negative number, so the grid is still positive in relation to the cathode. Saying electrons are *repelled* from the cathode is imprecise electrostatic talk. There would be no reason to expect the electron to be *repelled* in any particular direction, IE there would be no reason to expect the electrons to be *repelled* only toward the grid if repulsion is the mechanism.

What we actually have is a potential *field* between cathode and grid, and the electron is compelled to move through that field by the potential *difference* between the two points. We can think of this field as analogous to gravity, with the more positive terminal equating to *down* for an electron in the field. Electrons always move toward the more positive point, and that's why talk of electrons travelling from anode to grid makes no sense at all because the anode is always more positive than the grid.

[Fred said]
>>The amount of amount of heating of the grid is determined by

>
> The grid draws current when the cathode is negative. The cathode is
>driven negative for somewhat more than 10% of the cycle. Why wouldn't
>grid-heating be determined by RMS values instead of peak values?

It is, but RMS is only peak/1.414 for sinewaves. Since there is an electron flux from cathode to grid for only approximately 10% of a cycle, the flow is not a sinewave. Thus to get RMS you have to perform an integration of electron flux over time. Remember that the definition of RMS says RMS is that equivalent DC voltage which has equal heating value across a pure resistance as the particular AC waveform would have. In the general case for arbitrary waveshapes, integral calculus must be used to determine RMS. Only in the special case of a pure sinewave can we use the square root of 2 as the equivalence function.

>This seems reasonable.
> However, the point of this discourse is: Are we to believe that less
>than 0.5 amperes of DC grid current boils gold off a grid that was designed
>to carry over 40 amperes at 250MHz?

Well, *if* the grid wires were designed to carry 40 amps (they're not), then you might have a point. But since they *aren't* designed to carry 40 amps, and simple inspection and consultation with a wire gauge table would tell you that, your assumption is false.

> Boiling and evaporating gold in a vacuum requires well over 2000 deg. F.

>a 50x microscope. IMO, the damage I saw was unlikely to have been caused
>by HF currents. The argument of 0.5A of grid current causing
>gold-evaporation smacks of undiluted technoblather.

Well, using your numbers, the surface area of the grid wires is about 3.24 square inches. If the gold plating is 20 microinches (a common plating depth), then we have a total of 64 millionths of a cubic inch of gold, or 3.9 millionths of a cubic centimeter. Gold masses 19.32 grams per cc, so you have about 75.35 micrograms of gold (I came up with a figure for one wire of 14.4 micrograms earlier, but I didn't have an accurate circumference figure then). The melting point of gold is 1063 C.

It takes 80.89 kj to raise the temperature of 1 kg of gold 1 degree C, or 80.9E-6 joule to raise a microgram 1 degree C, so 75.35 micrograms needs 6.1 millijoules to raise its temperature 1 degree C. And it would take 6.1E-3 * 1063 = 6.48 joules to raise 75.35 mg of gold to the melting point. A joule is a watt*sec, so if we neglect cooling losses due to conduction and radiation, it would take 6.48 watts applied for 1 second to melt *all* the gold plate on the grid wires. Of course we can't neglect conduction and radiation heat losses, so it takes somewhat more power to melt the gold, but nowhere near 500 watts.

The conduction losses are the most significant because the radiation losses for the grid are minimal thanks to the construction of the tube, IE the grid is encapsulated between the hot anode on one hand and the even hotter cathode on the other. To show any net radiative cooling, the grid has to be hotter than the things to which it is attempting to radiate the heat. The grid substrate is tungsten, which is not a particularly good heat conductor for a metal, and the heat path is along the relatively constricted and lengthy path back to the grid ring. So it doesn't take much beyond 6.5 watts to cause the gold to melt.

The heat input is all to the surface, due to electron work function and kinetic effects of electron current flow in the tube (and skin effect for RF currents induced along the grid wires), so the gold has to throw off

the heat at a rate such that the equilibrium temperature remains below
1063 C to avoid becoming molten. This is a nice thermodynamic problem,
and I'll let someone else work out the details, my CRC has already had
a workout tonight.

> I believe that the most likely explanation for the 0.5A/gold-evaporation
>argument is DENIAL of the incontrovertible fact that the 8877 is a high-Mu
>device that is quite capable of oscillating at VHF---unless its VHF voltage
>amplification can be made sufficiently low by reducing the VHF
>parallel-equivalent R load (VHF-Rp) on the 8877's anode.

The lowest possible Rp comes via a RF short between the anode and common.
The current mesh for that is from anode to plate tune capacitor to chassis
and back to the grid contact (the defined common in this circuit). Since
the HF plate tune capacitor is already a very low impedance for VHF currents,
the only place a significant resistance could be added would be in the
plate lead between anode and the plate tune capacitor. Adding resistance
to that lead does increase Rp. And that's exactly what your nichrome wire
does, at all frequencies, not just VHF. (But of course this Rp stuff is
a total misrepresentation of the purpose of a parasitic suppressor.)

> The designer of the MFJ-Ameritron AL-1500 amplifier made no attempt to
>reduce the VHF-Rp load on the 8877's anode

Actually, he did, by avoiding adding extra resistance beyond what was
necessary in the plate lead. As noted above, since the plate tune capacitor
is a very low impedance at VHF, the only significant place in the mesh to
introduce resistance is the plate lead. Using nichrome there raises Rp,
at all frequencies, over using copper or silver plated copper. You get
the lowest possible Rp by using the most highly conductive plate lead
possible.

To oscillate, a stage needs a gain of at least 1 at the frequency of
oscillation. But that isn't a sufficient condition for oscillation,
a feedback path must exist and be such that the feedback is positive
at the frequency of interest as well. The latter is what a parasitic
suppressor really does. It dampens undesired (parallel) resonances
which could allow positive feedback voltages to build above breakeven.
It has nothing to do with Rp, it is a series damper. In your own words,
it lowers VHF Q.

It does that by shunting a portion of the VHF energy through a pure
resistance while not shunting the bulk of HF energy through that
resistance and introducing an unnecessary loss. You could use a
plain resistor as a parasitic suppressor if you wished, but that
would lower efficiency at HF. Using a highly conductive inductor
to shunt HF energy around the resistance improves HF efficiency.

Winding the inductor from nichrome doesn't materially alter the
VHF damping because the shunt R in the suppressor supplies the
necessary damping, and you can adjust that shunt R to get any
value of damping you may require. But the nichrome inductor does

introduce an unnecessary extra loss element at HF where series
damping is neither needed nor wanted.

Gary

The voltage drop across a metal-vapour arc is on the order of 15v and the voltage drop at the clamp connection to the rod is close to zero volts. Is 400a x 15v more power that 400a x virtually zero volts?

The electron-tube engineers who designed, refined and tested the 8877 were of the opinion that gold-sputtering from the 8877's grid was due to an 'oscillation condition'. Have a look at a gold-sputtered 8877 grid through a microscope, Gary. You might learn something.

Dana...

The reason why I did bring this up is because of the fact, that anytime a radio is modified to cover a range of frequencies other than those it was specifically designed to do in both it's receiver and transmitter chains, performance of ALL filters are degraded.

Unless extensive modifications are made to those chains, it's likely that the signal transmitted will lack the spectral purity the radios which are designed for the service would have. As for the receivers? They too would usually would suffer some performance characteristics as well.

Again - it is poor engineering practice to do this.

I suppose you want a coil whose reactance is 50 ohm at 100 MHz.
That will be around 80 nH of inductance. Try 5 turns of 0.7 mm
wire with 5 mm inner diameter and just over 7 mm long.

Gary: There is NO 'bread slicer' in a 250MHz 8877 tank circuit. The main tune-C is the anode to grid C of the 8877 itself. The resultant Q is around 30. Thus, virtually all of the tank current circulates through the anode to the grounded-grid. In such amplifiers, the tank L is typically a piece of silver-plated brass tubing that clamps around the anode.
>

I measured the grid to anode C in two 8877s and it was slightly more than 10pF in each. The Eimac specification sheet is accurate and Tom isn't. IMO, self-recognized "experts" are reluctant to admit to anything that might errode that which was self-bestowed.

2234. KnightKit "Ocean Hopper" Front Panel Replacements

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-22 00:00:00 UTC
From: 3W8PE1B <willi6@erols.com>
Message-ID: <330F2CEA.68F1@erols.com>
Source record: 96937
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.shortwave,rec.antiques.radio+phone,rec.radio.amateur.homebrew,rec.radio.swap,rec.radio.amateur.equipment

For those of you out there who are in the midst of a nostalgia trip, restoring an old KnightKit "Ocean Hopper", I've found an excellent source of replacement front panels.

These panels are made of heavy gauge metal with all holes pre-drilled (correctly sized and placed). They were professionally painted and all markings silk-screened by a company that specializes in custom enamel work. The color match and finish is very close to that of a sample "Ocean Hopper".

These panels are available from Dave Ishmael, WA6VVL, noted "Ocean Hopper"
restoral guru, and author of "Vintage Anthology - Book I" and other articles
in various ham and antique radio publications. Dave had these produced to
support his own restoration projects, and was kind enough to have a few extra cranked out for the other "Ocean Hopper" affecianadoes. He only had
a limited number made and only a few of those are left.

Even if you do not have a current "Ocean Hopper" project in the works, it might be worth grabbing one+ while they are available. Both of the "Ocean Hoppers" I have found showed their age on the panels and it would have been difficult to restore back to "as new" on an individual basis.

The other possibility would be to use the front panel as the starting point
for any homebrew regen project - has holes for Main Tune, Bandspread, Antenna
Tuning and Regeneration.

Price is $20 for one, $35 for two, and $45 for three. Post Paid.

* * * UNSOLICITED TESTIMONIAL - Spelling ;-) * * *

I only know Dave by reputation in the "Ocean Hopper" community and from reading his articles. Having a fair idea of what it would cost to have one or two of these done with any quality, I ordered three from Dave. I was extremely impressed by the quality and authenticity of the panels and doubt that Allied Radio did any better back in the 50's. These will save me time and $$$$ on my two restorals! Dave K7HMP

> do this....Thanks.
==========
Not a stupid question at all, and the precedent goes
back to the conversion of earlier 11 M. kids walkie-talkies
into the 10 Meter band.

There is an article in June 1980 issue of 73 Magazine on a 6 Meter
conversion. These usually used the older types with regen receivers
and lots of room in the case. Usually just change the xtal and
repeak a coil or capacitor. The one in the article is a Radio Shack
(a/k/a Archer) Model 60-4001.

Some of the newer units may use more sophisticated circuitry with an
Integrated Circuit - may take a little thinking. The biggest challenge
is finding one that you can chase down a schematic for.

Have fun! Dave K7HMP

According to Carl Stevenson, unless you own an electronics repair house
and sit around all day "inventing" new radio stuff, you're not a 'real ham'.
You're just a yacker, beeper, or CBer (and multiple combinations thereof).

>
>glenn@snmail.jsc.nasa.gov

Did anyone ever make them this large? I'm not aware of this size
ever being made. 8 inches is about the limit, for technology
reasons. There is no big performance penalty due to the inevitable
air (or glue:-) gap, because there is already a large air gap
between the ends. I recently made some ferrite rod antennas by
threading dozens of ferrite beads onto a plastic rod. They were
comparable to antennas made with real rods. If I wanted to make
a killer ferrite rod antenna, I would use 2 inch dia toroids with
smaller ones inserted inside them to plug the hole, and stack them
up to whatever length I needed.

Ham Radio Online at http://www.hamradio-online.com is the world's leading amateur radio web site, read in 63 countries around the globe.

If you have not checked us out, stop on by and enjoy. There is always something new. We probably have more Amateur Radio "content" (articles, news, propagation reports and charts, disaster communications situation updates, photos and more) than any other Amateur Radio web site in the world. Hundreds of articles in the archives.

If you've been by, check on back and see what's new. We do updates every few days, sometimes every day depending upon our time.

We run Ham Radio Online as a self-funded, no ads web site devoted to radio communications and telecommunications topics. In spite of our professional appearance, we run the web site as a hobby.

While not extremely simple, I have my homebrew 6M transverter (so-so
photo and schematic file) posted on my www page. Visit and see if it
gives you any ideas...
Schematics for my homebrew 426 Mhz AM ATV transmitter are there as well.

These batteries are supposed to be good for about half the cycles of nicads and have about 25% more power. Before concluding they're exhausted, though, you might want to run them down till the computer shuts off a couple of times. My Compaq docs suggest that the charging may not be complete (or the battery monitor function may not work properly?) if there have been a number of shallow discharge/charge cycles. Anyway, if anyone finds a better way to charge them, I hope they'll post it. Apparently, keeping the heat down during charging is particularly important for these cells.

If internal gas were responsible for the big bang,, Fred, why does the vacuum in grid-to-filament shorted 3-500Zs often appear to be normal during a subsequent check with 8kV applied from anode to grid?

Are defective tubes making amplifiers go bang?
In shorted tubes where the filament helices are not welded to the grid, we have been able to centrifuge the shorted tubes (with the 5v filament operated at about 5.8v) and remove the short. Typically, it takes 40 to 60 seconds at 10g - 11g to straighten the filament. Tubes that we repaired by this method appear to function normally in RF linear amplifier service. We guarantee our work provided that the original vhf parasitic "suppressor" ---that allowed the tube to oscillate in the first place, which resulted in the filament helices being bent---is replaced with a lower VHF-Rp parasitic suppressor design to reduce VHF voltage amplification.

Rich,

Mistakes are often made when verbal conversations are repeated.

For example you confused comments Marvin Born made about a 3CX3000 with a AL-1500 even though Mr. Born swears he was very plain about it. You also stated all or most BC transmitters have marked meters and variacs for the filaments, and that wasn't true. You even misquoted my comments about the surge resistance.

After all those second hand information errors (and many more), the likelyhood your recollection is correct and that you are accurately repeating a conversation from the 80's seems farfetched.

If lowering Rp increases stability, as you claim, the lowest Rp suppressor is a short wide low resistance connection. You never did answer the question "are you telling us removing the suppressor and replacing it with a short will result in the most stable design?".

Since bangs can happen with or without grid-filament shorts, let's treat
those as a separate issue.

One reason why the vacuum can return to normal after a gas release could
be because, by the time you come to test it, the release has been
cleaned up again by 'getter' action.

From: kr4wm@sccoast.net
Message-ID: <MPG.d7a3907c1c171c989698@news.infoave.net>
Source record: 96714

I read somewhere that using pulsating DC will help to break the formation of crystals inside nicads, which is the primary reason they go bad (the crystals cause internal shorts). If one was to build a battery charger with minimal filtering- thus developing pulsating DC, would you need to consider the peak-to-peak DC voltage, RMS (if there is such a thing with pulsating DC), or average voltage, in calculating charging voltage?
Thanks for any "mentoring", Web- KR4WM

2263. Re-engineering Henry amp from FM--->ATV HELP!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-23 00:00:00 UTC
From: kr4wm@sccoast.net
Message-ID: <MPG.d7a3cca10e0d2989699@news.infoave.net>
Source record: 96717

I have a Henry UHF "brick" amplifier, model C40D02 (the 2 may be a 3, hard to see). It's a 1-5 watts in for 40 out amp. It uses one transistor to develop 15 watts, which drives a second transistor to develop 40 watts. It's tuned to 468.xxx. Now the question:

I called Henry, and asked how difficult it would be to re-tune the amp and use it on ATV at 439MHz. I was told that I probably would not have access to the proper equipment to retune it, and I concede to that. He further told me that it would only cost $30 (hard for me to believe they'd do it that cheap!). However, in discussing the problem with our local QRP group, the question arose that it may need biasing to put it in class AB or something like that. So at this point, I'm wondering if the person I spoke with at Henry was really an engineer, or a "customer service" person. Can anyone tell me exactly what would need to be done to convert a UHF amp from FM-commercial-mobile-voice-468MHz to Amateur-ATV-420-to-440 (6MHz wide signal) service? I really only need the basics, but if it gets technical, that's fine too. I just don't know a whole lot about television signals. I have a basic understanding of how to bias/tune amplifiers, but don't know how to apply that knowledge to ATV.

One other question- what would be involved in providing a switching circuit for low 15 watts/ high 40 watts? I've heard that adjustments to the transmitter need to be made each time you switch power levels.

Thanks & 73, Web- KR4WM
(A new ATV'er using a PC Electronics TC70-1)

I've seen that time and time again. I have a 3-500Z on the shelf that
is OK if it's run every week, but will arc if it sits for a month or
two.

If I test it with filament power from a cold start after storage, it
flashes over at 3 or 4 kV. If I let it cook with low anode voltage but
some anode color for a few minutes, it is OK.

Any amplifier I plug it into has "intermittent VHF
parasistics"..... hi,

>
Good point, Tom. Thanks for the reminder.

The problem is that the Ls/Rs suppressor is NOT connected between the
anode and chassis-ground. Rs/Ls IS connected to the DC blocking
capacitor, Cb, which is in series with the tune capacitor, C1.. IF Cb and
C1 had no internal VHF resonances, then using a low value of Rs might
result in a reduction of VHF voltage amplification. However, C1 and Cb
have internal resonances.
As I recall, when you replaced Rs with a short, the amplifier exhibited
signs of vhf instability. I have had the same experience. Presumably,
this is why the AL-1500 has a reputation for 8877-consumption. Obviously,
some resistance is needed in Rs to counter the effects of the
aforementioned resonaces. Explaining why mathematically is problematic.
Multiple resonances add a degree of complexity that thoroughly thwarts
circuit-analysis. However, from my experiences, an Rs of 25 ohms to 100
ohms appears to yield a satisfactory result in less than 3kW amplifiers.
For tubes like the 811A, I lean toward 100 ohms for Rs. For more
formidable bottles, fewer ohms seems to do the job. Our
parasitic-oscillation suppressor retrofit kit for the 8877 uses an Rs of 33
ohms.

IMO, a reasonable rule of thumb is to design a suppressor so that roughly
equal amounts of vhf current pass through Ls and Rs at the anode-resonant
frequency.** To further reduce VHF voltage amplification, it is probably a
good idea to replace all of the silver (and Cu) straps in the
anode-resonant circuit with something a bit more resistive. I prefer to
replace silver strap with two, unequal-length parallel Ni-Cr-Fe wires
spaced about the same width as the strap. This treatment is often
necessary in order to stabilize the TL-922 and the Henry 3K-A.

** However, Ls must not contain so much inductance that the voltage drop
across it at 29MHz causes Rs to be destroyed by excess dissipation. OTOH,
if Rs runs cool at 29MHz, it is unlikely that there will be much
suppressing going on at vhf. [for further information, see the March,1989
issue of QST magazine]

Let's rewind a little here. Someone said "I want to use my ham radio
in the land mobile/marine service". You responded with:

> It is not impossible to do it... But it is not good engineering practice.
> Amateur Radio equipment is not type accepted for marine use for a reason;
> they are not as clean on the output as the type accepted ones are.

I followed up with a comment that reason that amateur gear is not type
accepted for marine service has to do with how operating frequency
is selected.

What is wrong about this statement? Why are you "questioning my
relevance" in this discussion?

>Unless extensive modifications are made to those chains, it's likely that
>the signal transmitted will lack the spectral purity the radios which are

>designed for the service would have. As for the receivers? They too would
>usually would suffer some performance characteristics as well.
>
>Again - it is poor engineering practice to do this.

Perhaps, and then again perhaps not. First of all, the transmitters
I've looked at tend to use bandpass and lowpass filters; a radio intended
for use at 148MHz will probably have reduced output above 150MHz. It
is conceivable that the carrier level would drop more rapidly than
the harmonic levels, resulting in a degraded harmonic suppression
when measured relative to the carrier. However, with the drop in
the carrier level, it is more than likely the harmonic output
would be at a lower absolute level than if the radio were being
operated in the 2m band it is designed for, which suggests the
potential for interference is not degraded.

It is well known that many amateur transceivers suffer poor receiver
performance outside the amateur bands. However, there's nothing
in 47 CFR that require type acceptance for marine band receiver.

Don't overlook the fact that some amateur radios *are* designed for
wideband use, and are then configured for a particular country. Looking
at the service manuals for several radios I've seen just this case - my
TR-2600A actually has extra circuitry to insure operation from 140-160
MHz, and this is enabled in export to certain countries. The IC-2000H
is similar, as well as many others

So, while some radios are indeed not good performers outside the
amateur band, others are. The potential for interference that
type acceptance attempts to address is interference caused by
improper selection of operating frequency and mode, not dirty
emissions or poor receiver performance. Technical standards
for emission purity exist regardless of type acceptance standards.

If I am in error, please feel free to show me exactly where.

Cross-posted to:
alt.support.divorce,rec.radio.amateur.digital.misc,,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space

I am the way I am because as a teen I was an active ham radio operator. I used "the mike" to not face real people thus missing my teen years the way real people experience it. It is not ham radio's fault of course, the fault is entirely mine. However I am not that person now and I despise in others what I despised in myself. I am much like a reformed smoker (they tend to be fanatics against smoking). When I hear hams on the air blabbing on about nothing, doing nothing, being nothing, kissing each others butts so much their lips turn brown I want to anything other than be like them. Further I was a gutless wimp up to 18 years of age (fit
in well with ham radio), I would cower with the slightest threat but I learned that fear is far worse than being beat up and rarely would have anyone beat me anyway. So today if you want to threaten me the odds are high (especially if you are a ham) that nothing will ever be carried out. And if threatened I always tell the person to carry out the threat even if my acts that caused the threat were wrong because once you threaten me that closes the door as to the legitimacy of your cause.

To those folks in the ASD support group much of the above applies. Most of you are uncaring men whose spouses finally wised up (hams make great uncaring spouses). In the end I am a far deeper and caring person than 90% of you. And to those that PERSONALLY insult me and/or use profanity, those acts say so far more about you than I. If you read my mail carefully you will rarely see me personally insult anyone and rarely will I use profanity. I argue ON THE MERITS. When you see someone attack the person it means their cause is without foundation.

I wonder why, whenever anyone gets into this big type acceptance issue of using "Amateur on Commercial Freqs", nobody ever asks why so many of those damn Commercial radios that everyone has on the ham band is never mentioned. They are not type accepted for Amateur use either. Spectral purity, out of a commercial Maxon-Regency-Uniden, not very likely. The real issue, people using $300 keyboard programmable radios for their plumbing business rather than going down to the Local Moto shop and buying a $800 GP300, thats it, plain and simple, and is probably the biggest part of the "Type Acceptance" equation.

One of you is right, it is simply the keyboard programmability that keeps the amateur radio out of the commercial band, as far as type acceptance is concerned. A Moto JT1000 has a UHF bandwidth of 403-470, as does most Yaesu FT50s, filtering, or lack there of is virtually identical, like in zilch. But the JT supposedly takes a rocket scientist (i.e. 2way tech with a key) in order to "keyboard" program the thing, while the Yaesu takes someone who can read. Type acceptance of the Icom U/H-16 portables (commercial) was temporarily suspended when FCC found that anybody could actually keyboard program the radio, and reinstated when Icom made the access to the keyboard more difficult for the end user. Yet, this very radio was sold in amateur radio service as a Icom 02AT and O4AT, and check a schematic and parts list, they are identical in every way except the software, which allowed easy keyboard entry. Harmonics, intermods, and selectivities, had absolutely nothing to do with the type acceptance issue, only the ease of frequency moving, and of course, the commercial U-16 sold for several hundred dollars more that the 04AT.

So basically, when the FCC knocks at your door, then and only then does it really matter. And if you actually have a license for the frequency(s) you are using the "unaccepted radio" on, the penalty will be worth the savings.

Some fun reading, check out the NOIs and NPRMs over the last several years regarding type acceptance issues, and take carefull note of who it is that is petitioning the Commission for most of the changes (stricter) changes, and you will find a lot of Schaumburg and Lynchburg addresses.

Exactly..*I* am the owner/operator of the PBBS and *I* decide what gets read. *I* take the input of the people who utilize MY equipment, *I* decide what content is acceptable or not. Not YOU or the FCC

That's who the hell *I* am. *I* and the others on my PBBS consider your posts inappropriate to anything related to amateur radio, hence, no posts.

I firmly believe you have every right to show the fool that you may or may not really be. HOWEVER, I DO NOT repeat, DO NOT have to give the platform to prove it. That's for others to do.

If you're suggesting that I have to allow you to access my property (equipment, etc.) then you are barking up the wrong tree.

In addition to the physics described above, the number in the model number usually is the maximum value of the variable in pF. You can calculate the voltage rating from the plated spacing and the dielectric constant.

Instead of spending way too much money on Greenlee punches, Check out the Unibits available at Sears. I use them all the time. One starts at quite small (<1/8") and goes up to 1/2", the next up starts at 1/4" and goes up to 1" in 1/16th increments. Great as long as you have clearance behind the hole. It's as clean as the chassis punch and'll cost you LOTS less.

>
Good point, Tom. Thanks for the reminder.

The problem is that the Ls/Rs suppressor is NOT connected between the anode and chassis-ground. Rs/Ls IS connected from the anode to the DC blocking capacitor, Cb, which is in series with the tune capacitor, C1, which is in series with part of the chassis which in series the grid to anode capacitance.. IF Cb and C1 had no internal VHF resonances, then using a low value of Rs might result in a reduction of VHF voltage amplification. However, C1 and Cb have internal resonances. IMO, the suppressor's resistance helps to mitigate the influence of these resonances--probably more so at frequencies near the resonances than at the resonant frequencies themselves.
As I recall, when you replaced Ls and Rs with a short, Tom, the amplifier reportedly sustained a VHF oscillation. I have had the same experience. Presumably, this is why the AL-1500 has a reputation for 8877-consumption. Apparently, some Rs is needed in the anode resonant circuit to achieve VHF stability. Explaining why is problematic beause the multiplicity of resonances thwarts circuit-analysis. However, from my experiences, an Rs of 25 ohms to 100 ohms appears to yield a satisfactory result in less than 3kW amplifiers. For tubes like the 811A, I lean toward 100 ohms for Rs. For more formidable bottles, fewer ohms seems to do the job. Our suppressor retrofit kit for the 8877 uses an Rs of 33 ohms.

IMO, a reasonable rule of thumb is to design a suppressor so that roughly equal amounts of vhf current pass through Ls and Rs at the anode-resonant frequency.** To further reduce VHF voltage amplification, I believe it's a good idea to replace all of the silver (and Cu) straps in the anode-resonant circuit with something a bit more resistive. I replace high Q conductors in the anode circuit with two, unequal-length parallel Ni-Cr-Fe wires spaced about the same width as the factory-original strap. This treatment is often necessary in order to stabilize some TL-922s and Henry 3K-As.

** However, Ls must not contain so much inductance that the voltage drop across it at 29MHz causes Rs to be destroyed by excess dissipation. OTOH, if Rs runs cool at 29MHz, it is unlikely that there will be much

suppressing going on at vhf. [for more information, see the March, 1989 issue of QST magazine.]

In all honesty, Burt, you are the only one I've ever "locked out". And
quite frankly, I have found very few if any locally who will agree with
anything you have to say concerning amateur radio

I also reserve the right to preview all for sale messages for content. I
allow only amateur and amateur related materials to be posted. Cars,
guns, recipes all get round filed.

Funny, I have yet to see a radio that can determine a person's color
based on a callsign. Is this something new?? How can I tell a person's
color based on his posting to my PBBS?? Enlighten us Burt

The 3-500Zs that usually are sent to us have a grid to filament short.
Does it seem plausible that shorted tubes are being operated by their
owners in an amplifier to activate the getter?

We see very few gassy tubes. We check all incoming 3-500Zs for gas at
slightly over 8kV.

Are you really sure the battery is going dead in 15 min, or is it the battery charge monitoring software telling you it's dead? My (Crummy) KeyNote pentium laptop will loose track of how much time has been on discharge sometimes (not voltage) and tell you it's gotta shut down, the only fix is turn off all the powersaving features and just force it to really run the battery down which in my case, is a known software/bios issue. running the sucker down is the only way to really reset the counter.

Well,,, that's not true, just to keep the flames at bay, it calculates the amout of charge time, and deducts run time from it. If you swap batteries, or change the 2nd battery for the floppy, the battery may be at say 75% charge, it only is on charge for 25%, so the charge monitor starts fussing at 75% cause it expects it to be flat. Doesn't seem to be much of an improvement over the old nicad problems.

I understand NMH cells are much more sensitive to overcharge/gassing/seperator damage than nicads.
Anyway,,, good luck

>
> ...Peter

This thread is morphing from jamming to immunity, but....

Peter, you talk of realism. From my personal experience, most USA grade consumer electronics will crap out at about 5 Volts/meter. (This may now be starting to get better, as manufacturers design to meet EN standards and use the same design for USA.)

You say an HT "easily" exceeds 100 V/M for near field. Could you run me some numbers as to how strong the near field strength really is for, say, a 5 watt HT? (We are talking about an HT at 2 meters, with 5 watts into a ducky, right? Or maybe a cell phone at 1 watt at 900MHz.)

Now, let's move into your recommendations for immunity. Sure, we all would like our Gameboy to stand 10kV/M, but I think your eyeballs (and other balls) would pop like a bean in a micro oven at much lower levels. Ten thousand volts per meter electric field strength! No doubt over a frequency range of 10 KHz to 18 GHz. Have you any idea of what you are asking?

Can you tell me of any facility in the world that can generate even 1000 volts per meter over this range? If you wish to set such a standard, then you must expect that manufacturers world wide will be expected to actually TEST to that standard. ("Designed to meet" doesn't cut it in the world of RF immunity.) Do you realize the cost of all this testing?

(Mortgage the house and invest in RF amplifier companies!)

Finally, while I respect the capitalistic jingle of a cash register, I find your description of this instrument as "mission critical" to be absurd. "Mission critical" has an urgency which transcends "do you want fries, too" "Mission critical", to an engineer, means someones life is on the line; think night carrier landings or a shuttle launch or your anti-lock brakes or a premie incubator.

One thousand volts per meter a safe level for a cash register? So, just who will be standing at that register in that 1000 V/M field. Certainly not me. I have had the personal experience of 200 V/M whole body exposure. (If you must know, it's kinda pleasant at first, like a warm mellow feeling in your bones.) I can assure you that nobody would just stand there, looking goofy while they cooked. I can't say which way, or how fast, but run they would.

And now, 250 V/M for "all the other stuff". What can I say, other than "Read the above paragraph again!"

I'll close by listing my personal suggestions for consumer grade electronics. I freely admit that I am making a lot of sweeping decisions, but hey, it's MY list.

10 KHz to 500 KHz 2 V/M
.5 MHz to 1.7 MHz 10 V/M
1.7 MHz to 88 MHz 5 V/M
88 MHz to 175 MHz 20 V/M
175 MHz to 425 MHz 10 V/M
425 MHz to 500 MHz 20 V/M
500 MHz to 900 MHz 10 V/M
900 MHz to 2 GHz 20 V/M
2 GHz to 12 GHz 10 V/M
And further thought must be given to the bands used by vehicular doppler radar and the new wave of home communication and PCS stuff.

Comments / great thoughts / warm air invited!

If you go on the web and enter the website of National Semiconductor, you should be able to find the appropriate spec/data sheets you are looking for. If you can't get them electronically, it'll tell you how to get them via postal mail. I am not sure of the URL, but it is probably along the lines of www.nationalsemiconductor.com. Try using webcrawler or another search engine to find it.

Jeffrey's points are sound advice. I doubt the manufacturers will adopt a policy such as this since too many CBers or hams (seems the same now) are always looking to expand the frequency coverage of their radios, even for the flimsiest excuse. For those who are not professional RF engineers and techs: It is poor engineering practice to do this. And as Jeffrey pointed out in his message, price is no justification to do it. If you want to it as an experiment to learn - then do it. But remember that performance may not meet industry standards.

You mean the "(tech+ for 20+ years)" (see above) that I place *after*
your sig? That's no forgery or alteration, Carl. If I place a ">" prior
to it, then it certainly would be an alteration.

I append it due to your strange attempt to associate code ops with folks
who don't know how their radios operate, yet you claiming to be a state-
of-the-art engineer still hold an entry-level license after two decades.
I'm not the only counter-example (code op and builder) to prove your
claim false; most of the guys on the QRP list are also in that same
catagory.

You still haven't answered my long-standing question: What radios do
you operate on the air that you've built yourself? No fair scolding
the amateur community for not building if you yourself don't build.

Speaking of altering posts, why is it you alter my headers? You
constantly delete the "Followup-To: rec.radio.amateur.policy"
line I add to my header. Bad boy.

Hi,
I've put together an ALC circuit to help protect my PA. It is composed of four small capacitors a couple of resistors and a diode. RF is sampled and fed between two series capacitor(22 and 47 pf respectively). this is then fed thru a diode into a couple of series resisitors with the ALC out at then end of the series. At the point where the capacitive voltage diveder is used to sample the rf two resitors in series follow the point just after the diode connection. At the end of the series resistors is a positive 15 volt supply. What I cannot analyize is where is the negative voltage coming from? This network puts out 0 to -6 volts with 100 weatts drive. I do not think this is enough to turn my exciter down. How can I up this voltage? Thanks.

You can brew it and use it, but you can't sell it in quantity without type acceptance. The rules have not changed. Many manufacturers go ahead and advertize new equipment with the footnote "pending FCC type acceptance." Haven't you seen this in QST and CQ? Commercial equipment is type accepted for use in all services and does not require additional FCC blessing for ham use. Part of the type acceptance requirement for H.F. amplifiers is they cannot operate above 15 meters. Another one limits the maximum plate dissipation in the final tube(s) of amateur amps. Another one that comes to mind is that wire you have to cut to make your new transceiver transmit out of ham bands....

Hi Folks;

I wonder if anyone knows what the original application was for all of the surplus 88mHy toroids that seem to abound forever in flyer sheets, junk boxes, and handbook designs? They are very useful for all kinds of peaking, notching and band pass filter construction. They all seem to be constructed in similar fashion. Two separate windings of 22mHy each on opposite halves of a 5/16 inch square cross section powdered iron core about an inch in diameter, wound almost full with approximately #24 magnet wire. I suspect the original application was for telephone networking since so many seem to have been produced, but I have never seen one in a phone, unless they are potted into the old input matching network box. Does anyone have the answer?

Source record: 96755
Cross-posted to: rec.radio.ameteur,rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I got a couple of display tubes at a swap meet and I want to make a project with them but I haven't found any information yet. I am not sure these actually qualify as nixies. As I understand it nixies have an element for each of the ten decimal digits and the elements are
stacked vertically one in front of the other. Also I think nixie may imply they are neon.

What I have is a segmented display like an LED/LCD. There are seven elements forming the digit
'8' which seem to have a white phosphorescent coating; each one of these goes to a pin. Two other pins are connected to pair of thin wires (filamentary cathodes?, cold cathodes?) strung
vertically in front of the display segments and wired in paralell (one pin goes to the top of
both wires and one pin goes to the bottom). They are packaged in a miniature 9-pin tube. There is a version with a decimal point that has a tenth pin placed directly between pins 1 and
9 in a straight line, not following the circle made by the other pins. I hope I can find a socket for this one.

So anyway I am not sure if these are called nixie or not. I would like to find out more about
them especially what voltage to run across the filaments and to the plates. Also if any are available surplus anywhere I would love to have a few more. The ones I have are made by TUNG-SOL and labeled "DIGIVAC". Most of the markings have rubbed off so I can't read a part #.

The Tar Baby continued...

As most of you will recall, in an effort to clear up some of the misinformation put forth by a regular contributor to this forum, I agreed to perform some "scientific" measurements of parasitic suppressor materials.

While I don't claim my methods to be any more than normal laboratory practice, they were (and are) given a great deal of weight by this individual who's measurements by comparison are most unscientific.

Apparently, because I attempted to treat this individual with a degree of courtesy, he assumed that I was taking his side in this issue. NOTHING COULD BE FURTHER FROM THE CASE.

Furthermore, the individual in question had the gall to post the results of MY measurements on HIS home page, in an attempt to further the illusion that the data support his position.

When this became apparent to me, I wrote the following: (Identity of receipient purposely deleted):

Dear XXXX,

As you should recall, I agreed to make measurements of sample materials supplied by you and Mr. YYYYY to help "clear the air" on some of the issues of parasitic suppressor performance.

I did this from the perspective of one ham trying to help out his fellow hams with a sticky technical problem. It was clear in my mind that this was a strictly "amateur" activity, performed as a service to other amateurs, for which no remuneration was expected or required.

As you are also aware, I took the time to create a home page wherein I posted the results of the measurements so all interested parties could access them. Included with the data was the following declaration:

"This material is copyright 1997 by W. D. Stewart, Jr.
The material maybe be freely distributed for *non-commercial*
use if proper credit is given." (Emphasis added)

Since the publication of this material you have made a number of references to it in usenet postings, in an attempt to bolster your position in the discussion. I have no problem with your references to the material, other than what I perceive in some cases to be inferences

that I support your technical position.

I do have a problem however, with uses of the material
on your home page, which is clearly of a commercial nature.
It is my position that the incorporation of this information
is a violation of the spirit and intent of my original objective.
Furthermore, it could be inferred that I am somehow a party to
your business activities, which we both know is not the case.

Therefore, I am asking that you remove all references to
the material in question from your home page and any other
publications which are commercial in nature and that you
let me know when it has been done. Likewise, I have removed
the information from my home page.

Regards,

Wes Stewart, N7WS

In response to this, Mr. XXXX asked me to supply my telephone number to him.

I responded as follows:

I have an unlisted number and would prefer to not give it out.
Furthermore, I honestly don't know what more there is to discuss.

I have made a simple request; remove all references to me
from your home page and other literature. What is so difficult
about this?

If you need supporting data for your claims for commercial purposes,
then I suggest that you make the measurements or pay someone else
to do it for you.

Sincerely,

W. D. Stewart

In response, Mr. XXXX sent me a heart-wrenching tale about the
poor nursing school student that he hires to process the orders for his
products.

Unfortunately, the references remain on his page in clear violation of
copyright laws.

Beware dem tar babies ya'll

You are technically correct, but ethically wrong wet. If you set up
to provide a public service as a BBS, you have a moral obligation to
forward all legal mail, or at least not to limit forwarding based on
personal considerations such as who is saying what. SysOps who censor
mail are a big problem on the ham BBS network, and responsible SysOps
should and will route around them.

If you're not part of an open network, you're just cluttering up
valuable space on the bands, and are giving jerks like Burt more
ammunition.

snip...

A reverse diode across the coil is important since it protects the coil
from the otherwise large counter EMF across the coil during break. (I
measured 450v peak across a 24v relay coil during break.) However, such a
diode increases the break-time.
By placing a resistor in series with the diode, the break-time can be
decreased and the counter EMF held to a reasonable amount. As a rule of
thumb, the series R should be 2 to 3 times the coil R. More R =s faster
break-time, but with the trade-off of more counter EMF volts.

The make-time of a DC relay can be decreased by connecting the coil in
series with a resistor that has 3 to 5 times the resistance of the coil.
Naturally, this arrangement increases the voltage needed to operate the
relay. For example, a relay has a 240 ohm coil rated at 24v. A 720 ohm
resistor is connected in series with the coil. In order to produce 24v
across the coil, 96v must be applied to the series coil/resistor. This
circuit is recommended by Jennings, the company that manufacturers
vacuum-relays.
Here's how it works: Relay coils have inductance. For instance, the
Jennings RJ-1A's 26v coil has about 0.3H. It takes time to overcome the
inductance and build up a flow of current before a relay can close. The
circuit described temporarily provides more coil voltage at make, thereby
shorting the time it takes for current to build up in the coil. I
measured a make-time decrease of roughly 65% with the circuit described.

Hi Tom,

They were used as loading coils on phone lines to counteract the
capacitive reactance of long metallic lines. they would be mounted in
pole mounted enclosures or in splice case assemblies and were usually
found in little tin or metal assemblies with a half dozen or so in an
assembly which was stapled together. Hams used them for years to make
RTTY tone filters for TUs and such and many audio filters were
fabricated using these units 88/22 or 44/11 Mhz units. Still a real
nice little of magnetics for a lot of projects and probably still
available in some surplus venues.
Might look into some of the Late Irv Hoff's articles on RTTY and I
belive Vic Poors articles on TTY filters for more in depth coverage of
these rascals. Both fellow wrote for QST and Ham Radio magazines. I
believe Vic Poor is still around, Irv passed away a couple years ago.
Irv was a prolific author of RTTY articles and a sometimes pain in the
buttocks on the air if your signal was not 100 percent on shift and bias
free. But tis life I guess

Hope this helps..

Source record: 96764

Believe me, they're working on it just as hard as they can. I just found out that the new standards for ESD immunity (to replace the current IEC 800's) will have the effect of TRIPLING the amount of time it takes to test each IT device, from 4 hours to 12 hours. This at rates of $250 per hour. While the lab tech draws sparks from the ground plane under the DUT's cabinet (at a glacier-like pace), you get to stand around with your thumb where it's 98.6.
This is what happens when bureauocrats are given free rein to take a basically good idea to its illogical extreme, in the process turning it into a ridiculous money-wasting farce.

2321. Single chip SW radio

This is what the urban legend is,... but I just don't believe it. Type acceptance has alot more to do with who will be using the radio rather than its performance.
Remember; ham operators have to take a test (and presumably know something) and are individually licensed. Business radios users are not licensed, the business is. Marine radio licenses are similar. One of the criteria for type acceptance of business radios is that they not be easily field progammable. Remember, the users are unlicensed and often untrained.

Just my $0.02.

You're assuming that these radios were not designed to cover large
frequency ranges. How do you know?
Perhaps they were, specifically to cover many product lines, then software
(or hardware) restricted to the range under which its sold.

>to bias/tune amplifiers, but don't know how to apply that knowledge to
>ATV.

The bias system is critical, as is proper loading of each stage. The
efficiency will be very low except during signal peaks.

The PA will absolutely require a very good stiff bias system and
proper loading for signal peaks.

>One other question- what would be involved in providing a switching
>circuit for low 15 watts/ high 40 watts? I've heard that adjustments
>to the transmitter need to be made each time you switch power levels.

If the PA is linear, all you need to do is switch in a pad in front of
the linear, or in an early stsge. If the PA and all stages are linear
no other adjustements are required or advisable.

But your own earlier statement was the nichrome suppressor your friend installed in the AL80 had a lower Rp than the stock suppressor, and less VHF gain. Are you now changing your tune?

Nice job on slandering the 1500, but the reason the 1500 has the reputation of using 8877's is much less sinister, The 1500 was released for production right when Eimac was having trouble with heat dams in the 8877. Neither ETO nor Ameritron, nor varrious medical companies had much sucess with tube life for a long period of time.

The only person who profited from this was a fellow in California selling fixes for pathological problems.

> there is mention of how this increases relay switching time, obviously
> a bad thing for packet.

In simple terms, a magnetic field holds the relay in, and the diode
prevents
the field from collapsing as fast by turning the voltage created by the
collapsing
magnetic field back into a magnetic field for some milliseconds.

Another reply suggested a zener diode - this works, and can be used to
"tune"
the release time by selecting different voltage diodes. Note, you will
need both
a zener and a regular diode in series to do this.

If you want the fastest release time let the voltage go really high by
using a
power mosfet to drive the coil. Most power mosfets have a decent breakdown
voltage rating and many are spec'ed for certain breakdown energies. Don't
use any diode across the relay coil, just let the voltage go up to the
mosfet's
breakdown (which could be well over 100 V).

I have seen the IRF613, anong others, work very well in this application.
Most
any power mosfet will likely do. Just because the thingy breaks down
doesn't
mean it gets hurt... Try it!

2327. Need help constructing a transceiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-24 00:00:00 UTC
From: bryant13@aol.com
Message-ID: <19970224023900.VAA05008@ladder02.news.aol.com>
Source record: 96806

I am a high school student who is attempting to construct a ham radio transceiver as an honors project for my Electronics class. I have built relitively few electronic kits in the past, but I feel pretty confident that I could get most things working with effort. I plan to construct a transceiver for the 2 meter band. And I am mostly planning to use voice and packet radio. I am looking for either a kit or good schematics. I would like to know if it is advisable for me to try to build a transciver from schematics, and if so, where are the best places to obtain schematics. I am also interested in any reccomendations people have as to what kits are inexpensive but of resonably good quality. I am willing to spend up to $200, but I would like to keep costs lower than that if possible. I would especially like to hear about any experiences that people have had with commercial kits. I would like a challenge, but I also want to have a resonable chance of success.

Date: 1997-02-24 00:00:00 UTC
From: n9vjg@aol.com
Message-ID: <331136dc.3611932@news.imaxx.net>
Source record: 96811

Are you reading this? Great! That means it wasn't written it for nothing. Not to worry, you won't be wasting your time.

Amateur Radio is a hobby and like all hobbies, it needs to be fun and rewarding. We at FBOM Magazine may not be able to straighten out your 40
meter beam after a hurricane or stop commercial satellites from squatting
on your VHF repeater input, but what we can do is present a lighter side
to all the QRM.

FBOM Magazine is the new generation of radio hobby publications, focusing
mostly on amateur radio operators (Hams). FBOM Magazine is for everyone,
from the guilt-ridden Extra class ham to a Technician or CBer that's tired
of being blamed for the erosion of family values in America. FBOM Magazine, the official publication of the Bad Signal Club--A free-thinking
state of mind where you are certified to transmit scratchy signals, crack a
joke without saying "hihi," tune up on some Little LEOS and have a good
time laughing at others as well as yourself.

As if that wasn't enough, FBOM also pokes it's nose into the world of the
scanner junkie and the strongest competition to wireless communications,
the Internet.

*
* GET YOUR FREE SAMPLE ISSUE!!!
*
* Email N9VJG@aol.com now for your free sample of the latest issue!
*
* Visit our Web Site which is still under construction and
* in bad need of updating. Just nudge your favorite browser to:
* http://www.interaccess.com/uncle-del/FBOM/.
* If you have America Online, visit the FBOM Magazine folder
* in the Ham Radio Forum message boards, under "Manufacturers,
* Dealers & Vendors."
*

Why YOU should subscribe to FBOM Magazine:

1. You will earn your official Bad Signal Club membership and will be
able to operate any bands with a scratchy signal and tell the
complainers
to stick it where the sun doesn't shine.
2. Blatantly hilarious and unusual commentaries on life as a radio
hobbyist.
3. No boring propagation charts. We replaced those with "Radio
Horoscopes".
4. No articles for home-brewing outrageous tri-banders and RF amps.
Just
step-by-step guides on how to build contraptions like a
"rubber-duckie
plane" for your HT and how to clean nasty things out of your
microphone.
5. Wacky contests where you can win antennas, free chunks of used
RG-58
and other prizes.
6. Free classifieds for paid subscribers.
7. We don't make you feel inferior if you work channel 19.
8. Hey.. we're writing it, so why aren't you reading it?
9. FBOM is 100% biodegradable and fat-free!
10. No test is required for this upgrade.

Why YOU should subscribe to FBOM Magazine NOW:

Rates are CHEAP! 2-year (4 issues) subscription rate of $9. 1-year
subscription rate (2 issues) for $5.

For only $9 you can have 4 issues of FBOM Magazine delivered to you.
Hey
that's a pretty good deal--especially for a publisher that is terribly
desperate to gain more subscribers!

How you can give us your hard-earned money:

*
* Mail a check or money order for a 1 or 2 year subscription to
* "Eric Bond" (That's me, the publisher and janitor) and send it
* to FBOM Magazine, P.O. Box 7711, Westchester, IL 60154-7711.
*

2334. Re: Re-engineering Henry amp from FM--->ATV HELP!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-24 00:00:00 UTC
From: norman <norsan@bright.net>
Message-ID: <5er5nt$1o2@cletus.bright.net>
Source record: 96813

First the amp, if its for FM is operating class c, to make it linear (AB) you need to foward bias the amp stages. This can be done by raising the base above ground by .7 volts. This can be done with 1 diode drop and a resistor divider (10 to 100 ohms). I have done this with a Henry 100 watt on UHF. For ATV the amp must be very linear--a foward bias of 50 to 100 ma should be fine.

Re-tuning is another matter. Most Henry amps I have seen use the transistor position on the strip line to determine the frequency so retuneing requires you to remove tha replace the transistor on the PC board. Most Henery UHF amps have about a 10 megacycle bandwidth.
It might be better to let them do it for $30 if you can not measure the resonant point on the PC board.

That's not very surprising. If you were a licensed amateur you would
(or should) know that there is no type acceptance protocol for
amateur transmitters, only for external rf amplifiers. Testing on
knowlege of these regulations is a part of the licensing procedure.

There are technical specifications for bandwidth and spurious
emissions, but these are the responsibility only of the control
operator. There is no requirement for any testing, registration or
labeling by a manufacturer or importer, aside from compliance with
Part 15, when applicable.

From: w9fs@juno.COM
Message-ID: <19970224.072021.9710.0.W9FS@juno.com>
Source record: 96823

It amazes me, I will have to say the amateur populist seems to be less informed than 40 years ago when I got started as a novice. I inspired me to go on and get my commercial license 1st Phone. But even as a Ham I learned what type acceptance is.

When a manufacturer builds a radio to sell in the US market, that radio must pass certain tests. The tests are much more rigid for commercial two way than for amateur, because in a effort to increase the technical abilities of a population and hopefully advance technology as a whole, the acceptance testing for amateur equipment was and still is not so tight that you can't sit down and homebrew a radio. Most all hams I've seen don't have the lab equipment that Motorola and GE/Ericson have. (That was Thomas Gasta reference to Shaumburg and Lynchburg).

If you hear a Motorola (Radius) GP300 or GM300 on the Amateur frequency you should know that radio had to meet a standard (TEST for acceptance) a much more rigid test, right at the amateur band then do the current amateur products on the market. Some Motorola products are spec'ed from 146-167MHZ (I may be off on the high frequency) While the amateur products have specifications for the transmitter for perhaps just a little outside the amateur band so it will cover mars.

Meeting those specifications really cost money which is then reflected in the cost of the radio.

Just had to open my mouth, that is the way it was and is, but things are changing all the time, may wake up tomorrow and everything be different

>100 ma should be fine.

One common reason most high power (over 20 watt) solid state amps go
into gain compression so quickly is because bias circuits like that
are used.

Bias current through the lower leg of the bias divider (that is the
diode) must be many times the peak base current at full RF drive.
If this guideline is not followed, bias goes away as drive (and base
current) is increased and the PA moves into class C !!

An active bias circuit using a transistor connected as a current
source is almost always required for good linearity unless a FET is
used in the PA.

Tom--- You and Dick Erhorn (ETO) have consistently blame 8877 failures on Eimac. This sounds to me a lot like not invented here (NIH) syndrome---i.e., it's always the other guy's fault. In a letter, Dick told me that he was sure that the 8877s that failed in his products failed from a manufacturing defect because Eimac replaced kaput 8877s, no questions asked. When General Electric reportedly got an earfull of Dick's excuse for failures, they cancelled his contract to build RF power amplifiers.for General Electric MRI machines

You reported that replacing Rs/Ls with a short in a 3-500Z amplifier resulted in a VHF oscillation. The 8877 has more VHF amplification ability than does a 3-500Z. It doesn't take a genius to realize that the 8877 probably needs a Rs/Ls VHF suppressor in HF service.
In the AL-1500, instead of an Rs/Ls, there is an inane short. At this point in the debate, I am hardly surprized that you hexa-stonewalled my question on whether or not the AL-1500 uses a VHF suppressor.

Denial of reality
Is a terrible malady.

Commercially manufactured amateur radio equipment (i.e. produced for resale) does in fact carry type acceptance. Take a look at the back of most radios, for instance my FT40 (yaesu), and it has the FCC ID (type acceptance) K66FT-40R and even a canadian type 511 101 525A. If you don't think the FCC regulates the commercial amateur equipment line, suggest a trip to Japan. You would love to have some of the "Amateur" equipment readily available in that country that is not imported to the US because they cannot be "type accepted". Now days, there are so many reasons for failing type acceptance that many radios never make it here. They may not have anything to do with "spectral purity", but the type is required. Home made stuff, no type needed, "yet"!

By the way, there is a perfect example for you that all the "type acceptance" crazies have for months discussed.

MOTOROLA, thats right, the big M, has manufactured a radio(s) that are Amateur Only called the AP50 and CP50. These are the same as their popular SP50 commercial radio, except they are keyboard programmable in the Amateur Bands. They are not available in the US (in theory) because they are NOT FCC TYPE ACCEPTED for amateur radio. Why, who knows, keyboard programmability into the commercial segment as well. Maybe, or maybe Motorola didn't wan't their own radios coming back to compete with their commercial endeavors, the real reason for type acceptance nowadays.

Yes, amateurs can make their own radio without type acceptance, but they cannot manufacture, in quantity, radios for sale or lease. I have heard a lot of people correcting my seemingly wrong statement. I would simply direct them to both Part 2.800 of the FCC rules and to the back of their very own commercially manufactured radios, and on the back, you will find an FCC ID number (the type acceptance). Type acceptance for Part 97 operations only, and on the back of their Motowhiz, another FCC ID for Part 90 operations.

As a licensed amateur, and one who can read and understand the english language, I would direct you to Part 2.800 and specifically to Part 2.1005 of the FCC rules, and if that doesn't work, take a look at the back of your kensucom radio, see that little FCC ID, know what that is, thats right, it is the type acceptance ID for that amateur radio. If you would like to read parts 2.981, 983, 991, 993, 997, 999, 1001, and 1003, you will see just how much trouble Icsuwood had to go through to be able to sell you that radio frequency device, and if you want to build one for your own use, Part 97 allows that, just don't build them for resale without going through the same trouble. Like anyone with such a poor understanding of "ALL THE RULES" could ever build anything!

Rich, you memory is very short, and you seem to have no desire to
learn anything.

Other people have posted the same thing about 8877's here on this
thread, and if you call Eimca (woops, if someone ELSE calls Eimac)
they will confirm what I am saying.

It is an absolute and well known fact the 8877 went through production
problems in the 80's. I understand it does noit fit your agenda, but
never the less.... it is true.

>You reported that replacing Rs/Ls with a short in a 3-500Z amplifier

>than does a 3-500Z. It doesn't take a genius to realize that the 8877
>probably needs a Rs/Ls VHF suppressor in HF service.

You confuse things by looking at small parts of large issues.

The 8877 has a high self neutralizing frequency. The excellent low
impedance grid connection reduces the requirements for a suppressor.
Tubes like the 833A, 811A, 572B, 4-1000, and 3CX1200A7 require large
and sometimes special suppressors. VHF capable tubes do not.

Pull a 3-500Z suppressor and put it in a 811A amplifier and the amp
will osillate.

The suppressor inductance in the AL-811 amplifier is about 500 nH, in
the AL-80B about 80 nH.

If the 8877 was as unstable as you clkaim at VHF, it would never work
in an unneutralized VHF strip line amplifier. Why is a strip line amp
with a strip line Q in the double or triple digits stable, and a HF
amplifier with less VHF not???

Your arguements make no sense.

>Denial of reality
>Is a sinister malady.

I accept your words without question. However I repeat my previous
allegation that radio amateurs are *not* required to use any type
accepted radios, and specfically I continue to insist that the
Motorola sets deigned for other services are perfectly legal for use
in the amateur service, contrary to what had been stated previously
in this thread.

From: hduff@ica.net
Message-ID: <3311bb5c.0@lightning.ica.net>
Source record: 96835

I want to mix 2 VCO's and amplify the desired output to around 0 to +5 dbm.
Right now I am using a level-7 mixer with the L.O. VCO input at 0 dbm and the RF VCO input at about -20 dbm. The output of the mixer is about -26 dbm. I have a LPF to pass the lower mixing component. The signal at this point is relatively clean. I'm trying to amplifiy the signal to about +3 dbm using 2 MAR-1's. I am experiencing a substantially raised noise floor when I use the MMIC amplifier stage. The MMICs are decoupled using a cap and choke on the supply lines.

Should I be able to cascade a couple of MMICs and come out with a clean signal ?

Are you perhaps confusing the different levels of Part 15 certification
with 'type acceptance"? "Type acceptance" is something very specific,
and only applied to external power amplifiers below 144MHz in the
amateur service. However, receivers are subject to some level of
Part 15 standards, and, in some cases, receivers must be formally
certified, and in others, not.

But, you knew all this and just wanted to flame anyway, right?

You are welcome as is anyone to contact my students (dormouse1@juno.com
or my daughter at aurora24@rocketmail.com) and ask them for your self.
Foul language? I used ass, report me. You no doubt have seen the vile
profanity used against me? When compared to the public at large I am
indeed an ass but when compared to hams I am far superior than MOST.

Can you tell me just what
> exactly it is that makes you a better person than any of these people
> you speak so poorly of?

I do not call my wife THE WIFE or my daughter a harmonic.
I have a life, I care about other people, I have guts to name just a
few.

I also pride myself on being a volunteer
> interpreter for the deaf, a volunteer for the American Legion, an
> advocate for the rights of Veterans and the disabled, among other
> similar interests. I literally volunteer more of my time than I work
> for a wage, I may be poor but if pride were gold I'm a very rich man..

All of the above makes you a better man than I. Notice I deleted what
you "do" for ham radio.

I too am an American
> and am entitled to my opinions and my opinion is that you are a bigot
> and have no business in the teaching profession if you are incapable
> of treating other human beings as the equals that they are. In the
> mean time, I'll be praying for your students..

No need to pray for them, ask them if they need your prayers.
Hams are not equals, all others are or are superior than I.
Just how am I bigot?

No one here has the intellect to deal with my students OR THE GUTS.

> measurements by comparison are most unscientific.

ï¿½ Wes has me on this one. My original measurements (1988) were made on a Boonton 50MHz-max Q meter. Since the frequency of most parasites are in the 90MHz to 160MHz range, the Boonton's 50MHz measurements are undoubtedly worthless in a debate, even though they seemingly provide a few clues.

> Apparently, because I attempted to treat this individual with a degree of

ï¿½ Apparently, Wes presumed that Mr. YYYYY (Charles Thomas Rauch, Jr., W8JI) received no remuneration from his employment by MFJ/Ameritron, ---yeah, right---. Apparently, Wes also presumed that my VHF suppressor retrofit kit business was a profit-making enterprise from which I received remuneration. Reid Brandon also presumed that I was making money selling suppressors. ---chortle--- I have never made money selling retrofit kits. When I was 14, Dan, W6BOK, the fellow who got me interested in amateur radio and gave me my FCC novice test, told me that amateur radio operators shouldn't profit from other amateur radio operators. So I pay my helper, Karina, whatever it takes for me not to profit from selling suppressor retrofit kits. In 1996, she made $1120 working a couple of hours for me each week. Shortly after the 9/94 QST critique of my Jan. 1994 QST article, sales plummeted and her income from working for me decreased by 2/3. Nice going, Reid, Fred and Tom.

> W. D. Stewart
> ....snip........
>
> Unfortunately, the references remain on his page in clear violation of
> copyright laws.
>
> Beware dem tar babies ya'll

ï¿½ U. S. Copyright Law provides for 'fair-use' quotes of excerpts from copyrighted materials---provided that credit is given to the copyright holder. It would be a violation of U. S. Copyright Law NOT to give Mr. Wesley D. Stewart, Jr. credit for a fair-use quote of any part of his copyrighted materials.

.....It sorta of looks like ol' Wes done went and picked up da tar baby.
.....

Perhaps the moral to the story is:
ï¿½ When someone recognizes himself as an 'expert' or a 'prophet', or a 'psychic', or whatever *sounds* great, NOT checking-out what he says could be a big mistake. In such cases, lest one become "one", one should probably keep in mind the words of Phineas Taylor Barnum in regards to "one" being born every minute. Amen to that, brother Barnum.
ï¿½ Real amplifier experts are likely to be familiar with AC Circuit-Analysis, Ohm's Law, algebraic expression, and scientific notation. . Most of the people I know who appear to be knowledgeable about what takes place in RF power amplifiers also have a minimal understanding of differential calculus and thermodynamics.
ï¿½ One way to tell a real and an ersatz amplifier expert apart is that one rejects AC Circuit-Analysis, as needed, whenever it casts doubt on his proclimations---and the other one does not
ï¿½ Aiding and abetting prevarication isn't likely to win public admiration.

snip...

A reverse diode across the coil is important since it protects the coil from the otherwise large counter EMF across the coil during break. (I measured 450v peak across a 24v relay coil during break.) However, such a diode increases the break-time. By placing a resistor in series with the diode, the break-time can be cheaply decreased and the counter EMF held to a reasonable amount. As a rule of thumb, the series R should be 2 to 3 times the coil R. More R =s faster break-time, but with the trade-off of more counter EMF volts.

The make-time of a DC relay can be decreased by connecting the coil in series with a resistor that has 3 to 5 times the resistance of the coil. Naturally, this arrangement increases the voltage needed to operate the relay. For example, a relay has a 240 ohm coil rated at 24v. A 720 ohm resistor is connected in series with the coil. In order to produce 24v across the coil, 96v must be applied to the series coil/resistor. This circuit is recommended by Jennings, the company that manufacturers vacuum-relays.
Here's how it works: Relay coils have inductance. For instance, the Jennings RJ-1A's 26v coil has about 0.3H. It takes time to overcome the inductance and build up a flow of current before a relay can close. The circuit described temporarily provides more coil voltage at make, thereby shorting the time it takes for current to build up in the coil. I measured a make-time decrease of roughly 65% with the circuit described.

Wow, that's great!! By cordless phone, you mean a hand held phone as opposed to a bag phone? Where in the world did you get a manual for it? What about changing the frequency? It's almost an 80 Mhz shift isn't it? Is that a very popular band? I've never even heard of anybody working the 900 to 928 band. (probably because there is no equipment for it)

Thanks for the reply

The use of the high voltage FET or bipolar transistor keying buffer is a better solution, and is quite acceptable from an engineering standpoint.

I think the other person suggesting that was more on target.

2373. Help with attenuator circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-25 00:00:00 UTC
From: pff@bfs.uwm.edu
Message-ID: <pff.32.001A8B09@bfs.uwm.edu>
Source record: 96653

Hi All,
I have built an attenuator to reduce the power outof my hf rig from 100 watts to 6 watts. The problem is I don't think it is working corrctly. I used a series of four pi circuits to accomplish the reduction. If I connect my rf out at a stage other then the last stage of the attenuator the output is lower then out of the last pi circuit. How can this be? Can anyone tell me the corrct way to build an high power attenuator? Any help will be greatly appreciated. Thanks. P.S. I do not have any sheilding around any of the circuit. It almost seem thatthe attenuator I built isn't working at all.

That I am not aware of (don't think so).

>
> There was some discussion in TT about the Cohn filters being very lossy
> if not tuned correctly and this is addressed to some extent in the past
> TT discussions.

I am not aware of this. A Chebyshev filter, improperly tuned, would have the same problem. The min-loss filter is just a little better than the Chebyshev. The idea of the Cohn (min-loss) is that for a given insertion loss it has the best skirt selectivity. The tradeoff is that the passband is not "flat". It needs to be properly terminated at both ends. At the output end, instead of a lossy resistor, a "dynamic" load, such as the input impedance of a grounded gate FET, or the input of a diode quad mixer, would be best.

The book "Single-Sideband Systems and Circuits" by Sabin and Schoenike, Second Edition, McGraw-Hill 1995 has a chapter on preselectors that discusses the Cohn "min-loss" filter design in detail.

>
> RF Design had a article comparing reed (I think) relay switching vs.

>also want to have a resonable chance of success.

Ramsey has a kit for I think around $100 but if I remember correctly you have to pick the frequency with a diode matrix or something that allows only a few frequencies to be used at a time. This rig is designed for packet where this is not a problem. I have heard mixed results in the actual construction and use, from, great to never again, but I don't know of anyone who didn't in the end get it working acceptably. I think the case and voice option are extra.

On the other end of the spectrum is the Ten-Tec kit, I think around $200, but is a full function rig when finished. I have heard nothing but rave reviews about the documentation and ease of construction and technical support.

Good Luck,

Glenn Sparks KI5GY

2376. SB-230 mod desired: QSK and 160m?

2378. Logarithmic speech processor

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-25 00:00:00 UTC
From: "William E. Sabin" <sabinw@crpl.cedar-rapids.lib.ia.us>
Message-ID: <33133111.12BB@crpl.cedar-rapids.lib.ia.us>
Source record: 96658

The Winter 1997 issue of Commnications Quarterly has my article regarding a Logarithmic Audio Speech Processor.

It uses an Analog Devices AD633JN four quadrant multiplier chip.

This chip is available fron Newark Electronics. They have 1750 of them in stock for $6.50 in small quantities. There is a $25 minimum charge requirement that can be filled with other parts for the processor, for example a microphone connector and some regulator and opamp chips and resistors and capacitors, etc.

An 800 number to call is 800-463-9275 for the phone number of the nearest Nerwark office where you can place an order.

Source record: 96659

I&#65533;m planning to build a tx, trx or transverter for the 1.2-1.3GHz-band, using SSB-modulation. Do you know of any plans, schematics or other information covering this subject, or commercially made kits? Is it difficult to tune the output frequency across the whole band from 1240GHz to 1300GHz? Most of the plans and kits I know (designed for FM-ATV or packet) cover only a part of this range. Should a transverter have an IF in the 2m- or 10m-band? I would be grateful for all useful hints.

These are vacuum fluorescent displays. The filament is the directly heated cathode. The plates, coated with phosphor, glowed when they are at a positive voltage. This type doesn't have a control grid that other versions have. That type of display is still used, although usually customized and multiplexed, for example, your VCR clock or Stereo's VU meters.

Looking at some old Fairchild and TI ap. notes, they used a 25 to 30 volt plate supply with a 10 kohm resistor. You grounded the plate to turn it off. Another example uses 60 volts where the display driver runs 8 displays, time multiplexed. These are general notes, so I'm not sure of the filament supply, but one schematic uses 1.6 volts.

>in engineering or RF work at all. It is useless at this point to continue
>a debate with you - since you are always right in everything you do, even
>when you are wrong. It's no wonder why hams have no access to much of the
>commercial radio sites. Think about it...

This personal attack is completely without merit and distressingly
out of place. If this is how you respond to challenge in a
technical discussion, then there is indeed no point to further
discussion with you. I am not always right, and I always wish
to learn, which is why I previously wrote:

So, while some radios are indeed not good performers outside the
amateur band, others are. The potential for interference that
type acceptance attempts to address is interference caused by
improper selection of operating frequency and mode, not dirty
emissions or poor receiver performance. Technical standards
for emission purity exist regardless of type acceptance standards.

If I am in error, please feel free to show me exactly where.

I'm not sure what "hole" I am supposed to be in - I'm not trying
to worm my way out of anything. I *was* trying to have a pleasant
discussion of technical facts - and you may note that I indeed
agreed with you, that *some* of the US amateur radio gear is not
designed for broadband operation. However, I have most certainly
seen US amateur radios that *are* designed for broadband operation,
and I don't think this puts me in any kind of hole.

Now, Mr. Wetzel, if you can turn off the "I'm right and you're stupid
and arrogant" flame mode long enough, please *show me exactly where I
am in error*. I must have made some serious errors indeed to lead you
to declare me an inept engineer, and I would like the chance to
address these errors. If you do not respond to this note, it will
be interpreted as a tacit admission that you are not capable of
carrying on a technical discussion without resorting to personal
attacks.

As for radio amateurs in commercial sites, the site owners I know tend to frown on radio amateurs primarily because of two things:

* Amateurs tend to act like they're entitled to a special discount on site rental.

* Amateurs tend to come tinker at the radio site, often bringing friends, and disrupt the equipment of the paying customers.

Now, maybe I'm wrong, but these are just my observations.

they are loading coils for telephone lines. You don't see them in telephones because they aren't put in telephones - they go in cables. Sometimes you'll see in an old overhead cable there is a "tank" spliced in; that's a loading coil case. In more modern construction they are just cased in with a splice.

What this is all about is that if you have the equation for attenuation of a wire line you find that attenuation can be reduced by adding inductance to the line. This was first discovered by Michael Pupin, who got a patent on it about a century ago. So loading coils are/were used on longer lines, not on short local lines. The 88 mHy coils are used in what's called "H55" loading, where H is for 88 mHy and 55 is 5500 feet separation between coils. There are other schemes involving other amounts of inductance and different spacing. While loading coils decrease attenuation at voice frequencies they cause a line to have a more or less sharp upper cutoff frequency. So for higher frequency performance you need to have less inductance closer together. I believe H55 was the most popular loading.

These days loading is not used much because there are things like T-1 carrier that drive a twisted pair at 1.5 megabits/sec; and it's cheaper to get gain electronically.

2385. 300 Mhz band?

Newsgroup: rec.radio.amateur.homebrew

Source record: 96665

I just saw a short blurb in PC Magazine that says the FCC has set aside the "300Mhz frequency band" to be used for free access for schools, libraries, and businesses for wireless computing. It mentions the development of so-called Unlicensed National Information Infrastructure (U-NII) devices.

Could someone point me to any details?

Thanks,

Okay, folks, enough is enough. PLEASE, let's end all of this petty arguing, griping, insulting, and personal attacks on each other. As I recall, these newsgroups are for discussing EQUIPMENT, and not for discussing our opinions of each other and so forth.

I know that we all have the right, and ability, to just ignore the arguments, etc, and read the worthwhile posts, but it's annoying to have to wade through the muck to find the relevent posts.

PLEASE... if you have a problem with someone, and you feel some kind of need to insult them or argue with them, do it via private e-mail. Don't clog up the newsgroups. Let the rest of us enjoy them!

Thanks! (and if you feel you must flame me, do it privately!)

You could improve on the signal to noise ratio by mixing at higher level
+7 dbm at the LO and 0 dbm at the RF port.You may have a reason
for using lower levels; if it is the case, you could use a solid state
active mixer. Analog devices has a very interesting 500 Mhz mixer if
your frequencies are lower than 500 Mhz. Can you state your frequencies?

I think Kokusai was the correct spelling. I remember having a 455 KHz
mechanical filter made by them. It must have been over 25 years ago.

check "my favorite links" for links to kit manufacturers on the web as
well as a very nice code practice program Codemaster V from milestone
technologies. I got this one and it is really nice and not expensive
$30. It is a DOS program but runs great under Windows 95.

>Of course, some would have us belive such a final would never work!

I have a "reject" 8877 acquired as a sample from my friend W6TC sometime
before 1980 as I recall. I have used it in the W6PO design two meter
amplifier with a SILVER PLATED, HIGH Q, PLATE CIRCUIT, without a trace of
nichrome to be found.

It is stable, reliable and tunes as if on 160 meters. I have used it for
tropo, meteor scatter and EME for years. It has never arced, sparked,
oscillated or passed wind in all this time. Of course, I believe the dry air
here in Arizona helps mitigate the damaging effects of cosmic rays, preventing
sudden bursts of VHF oscillations which, as we all well know, can cause gold
atoms to migrate to the output coax connector, in turn causing a high SWR.

As is also well known, the high reflected power is then dissipated in the
plate resistance (Rp) of the tube. Because this resistance has a positive
temperature coefficient, Rp tends to increase without bound. As has also been
explained here many times, gain equals mu * Rp.

Because the resistance is ever increasing, the gain must approach infinity. Since the input (drive) power is constant, the output power must then try to approach infinity as well. A practical limit is reached, however, when the electron suction force (esf) becomes strong enough to pull the line cord out of the wall receptacle. (For the newcomer to this field, the unit of esf is the flake, named after a well-known west coast amateur. These are very tiny units though, so we usually use mega-flakes in theoretical work.) But I digress...

In the event that the reader lives in a damper climate, say Ventura County, California for instance, where cosmic rays are more troublesome, a judicious application of nichrome wire may be called for. If one makes a coil of this material and installs it in series with the line cord, a number of useful benefits occur.

The immediate benefit accrues to the person who sold the nichrome wire (and the poor neighborhood nursing student who comes over on weekends and licks envelopes, or whatever, for the salesman).

A secondary benefit is that the tube heater will never be supplied with too much voltage. If the formulas supplied by the salesman are followed, the heater temperature will be lowered enough that the pesky problem of electron emission from the cathode is eliminated! Without this flow of electrons, the grid is no longer subjected to constant bombardment and it too runs much cooler. No more gold migration, reduced grid dissipation and when a cosmic ray goes zipping through the tube, nothing happens. Voila, the nearly-perfect amplifier!

Isn't science great?

N7WS

2407. Need a kit or schematic for a 10 meter single conversion RX

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-25 00:00:00 UTC
From: dselwa@qualcomm.com
Message-ID: <5evn9v$5ki$3@thefuture.qualcomm.com>
Source record: 96687

I need one preferably with an Rf gain stage for 10 meters.
It seems a lot these single conversion receivers need a bit
more gain on 10. I could take one for 40 or 20 and rewind the
coils but I think that I would be guesstimating the number of turns.

Source record: 96688

I don't have a schematic to my astron 20a. Can someone tell me if
I can change a resistance value to make it adjustable from 6 volts
to 11 volts (presently there is a mini-pot inside that adjusts from
10 volts to 15 volts). I know it can be done but with out a schematic
makes it a bit awkward. I'll bet there is a resistor in series with
the pot that if changed will change the range of adjustment. Call me
lazy but I thought I'd get a quicker answer this way.

From the back of my Tempo S1 transceiver: Receiver certified to meet
FCC Part 15 as of date of manufacture.

Heck, even my shortwave receiver has a label similar to that. So does
my TV set.

These devices are all unintentional radiators that radiate RF as long
as the device is powered up, so they should be regulated.

Funny that no such label appears on my amateur transmitters (as opposed
to the trans*ceivers*).

It's my understanding that commercially-built amateur transceivers must
satisfy type-acceptance *only* because the rcvr's oscillator is a Part 15
device.

My Sony ICF-SW 7600 radio (Italian version) covers the following frequency range 150-285 KHz step 3 KHz, 531-1602 KHz step 9-10 KHz selectable, 3850-26100 KHz step 5 KHz, 88-108 MHz FM step 50 KHz.

The American version of the same radio covers the LF,MF and HF frequencies with the range 150-29995 KHz. I would liKE to obtain the same HF frequency range as that available on the American version but the frequencies 1602 - 3850 KHz and 26100 - 29995 KHz are not receivable on the Italian version!

The radio is controlled by CPU (NEC D1715G 569), it has a PLL utility, is equipped with a keyboard and can store 10 items in memory. The receiever is 48055 and 455 KHz double version and demodulates AM and SSB.

At power on the CPU checks the jumper configuration (LW, step 9-10 KHz in MW, SW, FM). Setting the LW jumper to OFF extends the frequency range from 285 to 531 KHz, while setting the FM jumper to OFF extends the FM range from 76 to 88 MHz step 100 KHz. Setting the SW jumper to ON or OFF has no effect, the frequency range remains 3850-26100 KHz in both cases.

* Does anybody have the ICF-SW 7600 schematics?

* Does anybody know how to extend the frequency range from 1602 to 3850 KHz and 26100 to 29995 KHz?

Please send your reply to my e-mail address, as detailed below.

Thanks.

One way is to use a larger blower that spins slower.
Modifications to the case will be needed to hold the larger blower.
Bigger and slower is always quieter.
Make sure the different blower has about the same output(CFM).

I recently purchased a Kenwood MC-50 desk microphone, which has a 4-pin female DIN on the radio end. I need an accurate description of the DIN end wiring assignment, that I may use it for a Kenwood TS-440SAT, (which has a 8 pin jack).

In essence, I am going to convert from a 4 pin DIN to an 8 pin DIN. I only need the assignments for the 4 pin on the microphone stand, as I have the schematics for the TS-440SAT already.

Your help is appreciated. Thanks much.

From: chem3p_s@declan.chem.uwa.edu.au
Message-ID: <5etkib$r76$1@enyo.uwa.edu.au>
Source record: 96774

I need a 2000V power supply for my tube amp.
Rather than using a heavy, costly transformer, I've been considering
the possibility of using a DC to DC converter.

Using 2 large toroids (Amidon red, about 2 inches o.d.) stacked
together as the transformer, the primary would consist of a center
tapped winding with the center grounded and the ends switched on and
off by power mosfets. The input would be at 250 V DC. The output
would be a winding with about 8 times as many turns, rectified and
filtered with caps. The mosfets would be driven at around 1MHz by an
oscillator. I only need to work out the value of the primary
inductance required (any ideas?).

Will this work (I need about 1.7 kW) or is there a fundemental problem
which I havent thought of ???

Your idea is basically sound and full regulation can be obtained.
Design of an efficient switcher like you describe can be a complex
affair. Lots of details to work out... Ex: Appropriate transformer core
and winding (litz?, wide foil?), winding shunt capacitance needed for
core/winding, switch turn-on/off transients/snubbing, fast enough HV
diodes, other..
Suggest you read up on switching supplies a bit before begining to
build. Check applications notes from outfits like Unitrode, Motorola,
Linear, and other switcher chip makers...

Yes , I am going about it by using a cordless phone from Sony the
SPP-ER101 the radio transmit and reciever full duplex. The transmit
is only -7 db. This can be put into a cell phones brick to up the
transmit power. The Service manual only cost $12.00 and $4.00
shipping. The phone you can find for about $ 120 and you get two full
duplex transceiver that are in the ham band. Transmit between
902-927.600 Mhz. Very easy uP interface 3 wire. I am working on
making some link for a repeater.

I hope this help you..

2424. Cohn filters, a question of W0IYH

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-25 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <331260AB.1D11@tri.net>
Source record: 96779

Just finished reading another discussion of the Cohn filters in the Jan 97 Radio Communications, Technical Topics, p. 62 and have a couple of questions about the topic of receiver front ends in general to kick around. Where better than here.

Sabin discussed Cohn filters in QST July 1970, I think there was a similar filter used by Squires in an early, high dynamic RX using the 7360 tube as a mixer.

There was some discussion in TT about the Cohn filters being very lossy if not tuned correctly and this is addressed to some extent in the past TT discussions.

RF Design had a article comparing reed (I think) relay switching vs. saturated transistor switching and found the relays much inferior.

My homebrew 160 RX is a 15 year old Martin design using a MCL SAY-1 high level mixer with 23 dBm LO drive (a Gumm osc based on Hayward's Solid State Design for the Radio Amateur...it works better than Rhode's later simulation seems to indicate). This followed by a diplexer at 9 MHz, an early FET, the VMP-4 running grounded gate at about 150 ma current, into one of the KVG 8 pole filters, thru several Plessy gain/control stages, another KVG filter (14 poles total) and out. And old design.

I have the capability of switching in a 3 and 6 dB pad on the input and normally switch in whatever it takes to just have the noise level rise a bit when the input is switched from the termination (used during transmit) to the antenna. Then I manually adjust the IF gain so that the AGC doesn't bring the AF noise level too high when no signal is in the passband. (I never got around to getting away from the Plessy AF derived AGC so that method calms the AF output a bit.)

Input filtering? The antenna tuner. I'm setting here looking out of the window at 4 towers 3 miles away used by an AM station on 1150 and it's no bother. I don't even get a 2nd harmonic of a station on 910 about 8 miles away...probably a testament to their filtering!

After this lengthy introduction, questions:

Suppose I add the minimum-loss bandpass filter from the Jan TT, 4 sections, 4 dB loss on 160 with 66 KHz BW. This loss is about what I normally add. I'm apparently not bothered by the BC band signals and it certainly does not help much for contests as the whole contest band is essentially within this passband. What do I gain by adding this filter? (Can't get the passband much narrower without using a Q-multiplier type system or the loss gets too high for even 160.)

So possibly a different approach? Sabin (or was it Squires) used an impedance inverting circuit to present a reasonable load to an active mixer in the desired passband, but which thru the inverter presented a low impedance to the mixer (as the filter impedance rose out of the passband) lowering the gain outside of the passband (Av = gm * RL). You can't do this with a ring mixer as the reflected power circulates back thru the mixer causing all kinds of grief. (This approach must present all kinds of interesting situations to the filter which is normally designed to work with some fixed driving and load impedances.)

I throw this out mainly to get a thread going. As a long time RSGB member, Pat Hawker fan, I keep reading about the high RF levels in Europe, as presented by Chadwick and others, and high dynamic range efforts by all. I still can't see how a 20 M, 3 dB loss filter with a 510 KHz BW can do much more than lower the total signal level to the RX by 3 dB and help the blocking level, not dynamic range, that way. There seems from here to be a few high power signals in that passband. 40 m. looks worse.

Perhaps I'll take one of the pocket SW radios on my Sept/Oct trip to Amsterdam, Moscow, and St Petersburg to see what the fuss is all about.

Puzzled from Kansas,

N0UU

2425. FS 3 4-1000 tubes

Newsgroup: rec.radio.amateur.homebrew

Hi all, selling some tubes for a technician friend of mine.
He has 3 , 4-1000 tubes for sale. 2 of them have 4 months use, 1 has 1
month of use. These are tubes pulled from a Sparta transmitter that
his station is no longer using- went solid state. He is asking $100 pc
for them.

I forgot I had some literature specifically dealing with gas in power grid tubes. The following may explain some of Rich's puzzlement.

First a review:

On Sun, 23 Feb 1997 14:29:58 +0000, "Ian White, G3SEK" <G3SEK@ifwtech.demon.co.uk> wrote:

>R. L. Measures wrote (in reply to me and then Fred):
>>> >what about the cases

>
>One reason why the vacuum can return to normal after a gas release could
>be because, by the time you come to test it, the release has been
>cleaned up again by 'getter' action.
>
>73 from Ian G3SEK Editor, 'The VHF/UHF DX Book'
> 'In Practice' columnist for RadCom (RSGB)

Rich thinks because, when he hi-pots the tube some time later and it doesn't arc, he has proven a parasitic.

Here's what "Getters and Their Function in Vacuum Tube Manufacture" says:

page 4

"Gettering action takes place three ways, namely:

1.) By absorption of gas during dispersal of the getter.

2.) By absorption of the gas after dispersal of the getter.

3.) By absorbtion of gas under the action of an electrical discharge."

Number three is interesting.

An internal tube arc can actually getter the tube and remove the gas!!! It also goes on to talk about contaimination of insulators, and how an arc can clear the path.

Looks like the lack of proper research might have led to a false conclusion. Design level text on tubes indicates the arc path may very likely simply disappear after the arc is done.

Perhaps a magic gas measuring GDO could be used?

The same rules that allow us to build our own also allow us to
modify or otherwise adopt any radio for use on the amateur
bands. There have been hundreds/thousands of Motorola
radios pressed into service on amateur radio by hams.

There are two problems with your plans. One, you need to get a handle on the core losses at 1 MHz You can do this easily if you know the material type. The next problem is finding some power rectifiers that have a fast enough recovery time for operation at 1 MHz.(If you find some let me know.)

I have built some 300 kHz switchers that put out 2 kW AC. I used 8 Amidon FT-240-F cores in a stack. With this many cores I could get the volts per turn up to 33 without overheating the core. I could have used fewr cores, but the trade of was that I wanted to use silicon insulated HV wire for HV isolation and that didn't leave room for many turns. My primary was 9 turns of #14. The secondary was 15 turns of #14 since it was cheaper to buy one big spool of wire. I was planning to use a voltage multiplier circuit. Voltage Multipliers, Inc is a good source of diodes for fast power retification.But, based on their recommendation of 70 ns recovery diodes for 100 kHz, the 25-30 ns diodes, which are the fastest they have might be usable at 300 kHz, but probably not 1 MHz.

The input dc voltage was 300 vdc by direct rectification. My system is designed for 208 three phase, but I tested at 2 kW with full-wave rectification off 240 single phase.

The next problem is switching at high frequency. The driver is extremely critical to get a low enough driving impedance at the MOSFET gate which takes some effort. Also, the body diode in the MOSFETs is not fast enough for even 300 kHz, so you need external fast diodes.

Also, be on the lookout for high frequency oscillations that will destroy the MOSFETs during turn on.

My power switcher is a full bridge, with 2 IRFP340's in parallel in each leg. They barely get warm, so I'm pretty consrvative there.

But my learning curve was about 15 months. I have a 5 lb box of explode MOSFETs to show for it. One important item is a fast shutdown to kill the drive in under 1 usec if the peak current gets too high. This cut way back on major failures. One mechanism that caused me a lot of grief was when one device failed, for whatever reason and the device in series with it turned on into a dead short. This makes for plastic shrapnel and ugly arcs spraying carbonized plastic onto your circuit.

Most of the big, high power witchers use 40 kHz because of the aboe problems. I didn't have a choice since the customer wanted 300 kHz ac out. (My circuit works to about 450 kHz,by the way.)

I built 8 kW supplies using 4 modules with their outputs in series. I was shocked when my second generation boards had new problems that didn't bother me in the first generation. Layout is critical.

My overall opinion, 1 MHz is too high. 300 kHz is doable, but the cost of the cores is the least of your problems.

Don't mean to be discouraging, but you did ask if there was anything you were overlooking! :-) :-)

I just received the L?C Meter IIB which I ordered from Almost All Digitial Electonics in auburn WA. (http://www.aade.com)

The unit I purchased was pre-wired, but is available as a kit for $20 less than the $110 that I paid.

The construction is adequate, but not fancy, as one might expect at this price.

The unit is self-calibrating and simple to use. The design concept is clever and the implementation is nicely done. It has relative mesurement and percent deviation capabilities as well as straight measurements. It is completly auto ranging. All you have to do is turn it on with all other pushbuttons out so it will self calibrate, select L or measurement, push the zero button with a shorted input for L or an open input for C, and connect the part to be measured.

The first thing I did was measure the inductance of some 150 nhy chokes I had made. Low and behold, they were 150 nhy. I expected that they were somewhere between 100 and 200 nhy and I regard the similarity of the calculated and measured numbers as more of a coincidence than anything.

I had been looking for an old Tektronix 130 L?C meter for sometime and hadn't come across one. The L/C Meter IIB is much more useful on both the low end and the high end. And, it doesn't have to warm up for half an hour either.

The only thing I wold like to have seen done differently woul be to reduce the spacing of the 5-way binding posts to 3/4 inch so I could use the standard Pomona banana jack to BNC adapter.

Also, I noticed the 5-way binding posts are only 3 or 4 way. I forget what all the 5 ways are, but the ones used here are missing the through hole, so that eliminates at least one of the 5 ways, if not two.

I highly recommend this unit to anyone with a need to measure iinductances from 1 nhy to 100 mhy and capacitances from 1 pf to 1 uf.

The L/C meter IIB is a very useful addition to my test equipment collection.

2438. balanced tuner

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-26 00:00:00 UTC
From: Larry DiGioia <larryd@bright.net>
Message-ID: <3314E9A2.3197@bright.net>
Source record: 96495

I am building the balanced tuner per the Feb 1990 QST article. I have the parts, and I find that while the variable capacitor has a reasonably long shaft, the roller inductors have only about a 1/2 inch long piece of shaft that sticks out.

This is not too handy, whether you wanted to put a knob on it, or as I want to do, put a pulley on it.

Does anyone know whether there is such a thing as a coupler to extend the length of 1/4-inch shafts? Sources?

email replies, please.

> Roy Lewallen, W7EL

Ok, only reason I was going to outboard the new front end & mixer was
I'm using the w1fb universal DC rx and the board looks so nice without
me hacking it up.

Just one more question if you will, I have a 455KHz filter from Murata
it appears from the spec to be 2.5 KHz wide and is physically about 1/2
long and 1/4" wide in a metal can. Dont laugh but, Whats the difference
between this and one of the small black plastic filters you see
scattered all over inexpensive recievers? (Also made by Murata)

Thanks much,

Tim, ka8ddz

>should and will route around them.

Sounds like you have the U.S. Post Office and ham radio confused.
The big problem with the packet network is sysops who don't pay
attention, forward anything to anywhere, loose mail by letting things
sit on their system forever, etc. Running a BBS is something that
requires a) time and b) effort, and too many packet BBS's consist
of a TNC, a radio, a computer with BBS software that somebody's
buddy set up, and a ham running around patting himself on the back
calling himself a 'sysop'.

>If you're not part of an open network, you're just cluttering up
>valuable space on the bands, and are giving jerks like Burt more
>ammunition.

I think you have that backwards, too. I don't know who the first two hams were who hooked up TNC's and BBS software, but I imagine that the intent of the first link of the 'packet network' was to forward information, not garbage. Keeping the network free of garbage reserves valuable space for valid information to be passed.

The amateur packet radio network already forwards, by design, an incredible amount of garbage in the form of message headers. I don't recall the exact figure, but a few years ago I analyzed a months worth of ALLUS bulletins, and I think that headers accounted for between 40 and 50 percent of the total character count. Add to that garbage a totally unnecessary ASCII drawing at the end of every message, a few lines of advertising from the guy who wrote the whiz bang terminal program used to generate the message, and top it off with an ACK at the end so the receiving system generates a totally unnecessary return message saying the mail got there, and you run the percentage of garbage up well over 50%. The packet network does a wonderful job of diseminating garbage, but unfortunaly falls flat on it's face when it comes to delivering mail from one ham to another ham.

I agree one hundred percent with Steve. I supplied the two computers, three radios, three TNC's, assorted power supplies, cables, antennas, etc. that are used to run my packet BBS and DX cluster. I pay the electric bill every month. When the little red transmit light on one of my packet radios turns on, I decided what gets transmitted, and it damn sure won't be Bubble Head's Bible Quotes or daily birthday lists from the Happy Club. Steve chooses to keep certain people off his system. I choose to keep certain garbage off my system. We are both doing what we are supposed to be doing, monitoring and eliminating garbage.

My packet equipment isn't a 'public service'. It's a service provided for hams to use in relation to ham radio. Bible banging and birthday lists have nothing to do with ham radio, so I make the decision to keep that junk off my system, and not contribute to the confusion by sending it to other systems.

When you, TAPR, or the ARRL decide you would like to reimburse me for the cost of my equipment and start sending me a paycheck, I will be happy to revert to your system of not excluding anything from my BBS.

By the way, Burt's messages pass freely thru my BBS, as his topic of discussion always seems to be ham radio related.

73, Jim KH2D

Regarding Burke Baumann's message, it was very good. Perhaps I should had done the same thing when I was in this debate! In any event, anyone who's in the commercial radio service knows better than to modify amateur radio equipment for other radio services. It is poor engineering practice for a person to do so. I Thankyou Burke for your time in putting that together.

Hi:
I am interested in making some very high voltage caps for a loop antenna.
I gave up on the idea of making a variable HV cap so I will concentrate on
operating on a single frequency. My question is has anyone made some 30kv
rate caps using glass jars and copper tape or aluminum foil(heavy duty) for

a small loop antenna ? I understand that the er of glass is about 8, so
that I can
get away with 1/8 the surface area as compared to an air dielectric cap.
What sort of luck has any one had ?
Peter
PS what is the breakdown voltage of a typical canning jar ?

2444. Re: CELL PHONE----> ham band....anybody have any luck with these?

>What about channel selection? They have something like 25 channels don't
>they? I was kind of thinking of using the cell phones I have now and
>converting them to that band, but it's been REALLY tough to get anything even
>close to a service manual on them.
>Thanks for the info..
>TYler
>

The RF board has 9 conection.

1 - +B 9 VDC
2 - GND
3 - AUDIO output
4 - SQUELCH output
5 - VFO inable
6 - data in
7 - clk in
8 - PTT
9 - transmit audio

This board is on a PC board the can be easily removed. It is SMALL!!!
The conection can be easily made by a inline socket.

You will need to build your own uP. I will be using a PIC. When I
get the to this project I will shared my code with you.

I'm going to put a list of my Xtals on a page on my site.

If anyone has a list of their own please e-mail it to me in this format.

Email@server.co.uk

4000 27125 12005 3575 56121 1800
14500 etc etc etc etc

This way I can cut and paste between the lines and update my list.
please put all frequencies in khz and use no more that 6 rocks a line.
They don't have to be in any order as those searching can use the find
option on their browser.
I know it would be ideal to include xtal types but this can be asked on
contact with swapper. I would rather that money was not charged (maybe
P&P) but that true swapping/giving occured.

the URL will be http://www.chubs.demon.co.uk/xtals.htm

Oh and don't forget to visit my homepage on the way out.

Regards all.

The mosfet will harmlessly break down well before that. Just note that
some mosfets do weird things at breakdown, like oscillating for a moment
at several MHz. Don't use those ones ;)

Tom,

FYI, the first broadcast transmitter that I worked on ... twenty
years ago used the 8877. It was a grounded grid final with a
4CX250 as an IPA. I can't remember if it had a half wave or
quarter wave stripline in the output tank but there wasn't a
supressor anywhere in the final. It would make about 4.5 KW output.

The crazy thing ran very well at 105 MHz ... one final tube ran for
more than three years at that station making 3+KW output (100 Meter
stick with four bays of antenna in circular polarization).

Of course, some would have us belive such a final would never work!

> one [8877] final tube ran for more than three years

You know, Joe, the old Eimac guys say that, at full power, the life of the cathode never exceeded 6000 hours in their testing. The life you saw shows how little of the capapbility of the tube was actually being used when it was developing full power. I suspect--correct me if I'm wrong--that the transmitter was actually a 2.0-2.5 kW output unit with a station ERP of 5 KW, a typical Class A arrangement.

The design you describe closely parallels one of the designs that Fritz Bauer did when Granger Associates was building transmitters for him. I suspect Cetec might have, sometime later, modified one of Fritz's designs to use the 8877. The Cetec line was originally called Sparta and their 2 kW unit used a 4CX250B driving a 5CX1500A. After all the tube problems with the 5CX1500A in FM service (later fixed in the 5CX1500B) I suspect they were ripe for a tube-type replacement when the 8877 came along. It seems that the original price on the 8877 was less than $150; the 8873, 8874 and 8875 were $37.50 each when they came out.

Hey Burt,

About 4 years ago I posted a message on packet
from the N2IMC BBS asking for help designing
an antenna. You sent a one line response:

"First you need to get an education."

I replied to your message and you sent it
again. "First you need to get an education."

Now I find you on the Internet with a different
personality! Now you claim that it is wrong to
insult the individual, when that is exactly
what you did to me. I asked for help with a
problem I was having and all you could do is
insult me.

And you are trying to "correct" hams????
What nerve!

>--Rich-- ag6k, 805-386-3734

The technique works *VERY* well. I've been using a T/R switch for QSK
that uses an RJ-1A driven this way for 22 years now. My plate voltage
switch has a Cramer hour meter on it that had over 10000 hours of plate-on
all-cw time for my hand built pair of 4-400a's that goes through this relay,
before the first one got to dragging. I bought two back in 1974, one for a
spare, thinking I would use in a year or so....

Surprise, the first one went over 20 years of *HARD* use, --- I gave up
even *THINKING* about the zero's in the number of operations when I
got to trying to figure that out for all those hours since my plate voltage
isn't brought up unless I need the stuff.... Yeah I know, how much do
you really send in an hour, but, pileups are pileups etc... :)

Of course I don't switch it hot, but it follows stuff nicely up past 60 WPM
in this sort of arrangement. I couldn't say enough good words about Jennings
stuff, besides which the pair of vaccuum variables in the amp are also
Jennings. These relays are available through Davilyn, Corp. out in California
as well as Nebraska Surplus. If you get them, be sure and get the new ones.
Even at $100 or so each they are worth it. The reason is that pulls are
also available, but you really have no way of knowing if the pulls have been
subjected to abuse.

There are certain products that just catch your eye for craftsmanship. BMW
cycles, Beech aircraft pruducts... the knid of things that you just can't seem
to put down without looking at them first or looking back at it as you walk
away from it...

These little jewels are a tiny example of that kind of stuff...

Hi Tom

Tom I think part of the confusion here stems from the assumption that the only approval granted by the FCC is "Type Acceptance" and this is what is associated with the FCC ID number found on electronic devices. It also is assumed that this approval is related to the appropriate part of the FCC regulations for a particular radio service, in particular Part 97 covering the amateur radio service. These are both basically bad assumptions with the exception that some amplifiers for amateur service require type acceptance.

First in addition to "type acceptance" the FCC also issues several other types of "APPROVAL" including "Certification", "Type Approval" and "Notification". If you look at the ads for the ICOM IC-756 before it was approved it said waiting "FCC Approval" and nothing about "Type Acceptance". Also as I will show the "FCC parts" that the radio is tested to for approval may not in all cases be the same "FCC Parts" for the service the radio is going to be used in. This is not to say that an amateur transceiver does not have to meet Part 97 but that the "FCC approval" was not based on the part 97 requirements but instead on "part 15 " of the FCC regulations.

I own an ICOM IC-756 and waited several months for the FCC to "approve" this radio. During this time I repeatedly checked the FCC database to see if it to had been approved. (301-725-1072 for those who are interested. It might be a clue about the ft-920)

I apologize for the long attachment that follows. This is a capture file
from a session on this database.
It shows that the IC-756 approval was for a "notification" and was approved
under "PART(S) 15". The device was listed as a communications receiver
with a note that it was an amateur transceiver. Included in this file is a
definition of the fields in the report. Also included is a document
"MARKETING REGULATIONS FOR RADIO FREQUENCY DEVICES" that also contains info
about approvals and a document "Extended Coverage High Frequency
Transceivers". This last document covers use of amateur equipment in
services requiring equipment that is "TYPE ACCEPTED". It also states
"Transmitters designed and intended for use only in the ARS must comply
with the applicable technical standards contained in Part 97 of the
Commission's Rules but are not required to be
type accepted.

Some of the menus listings were deleted in the following capture file.

Data Element Definitions

The following data elements shown in applications records are derived
from
the data listed by applicants on the current edition of FCC Form 731 and
rule
sections governing the specific class of equipment.

Application Date - Date of Applicant Certification by
authorized
signature on Form 731.

Emissions Designators - Pertains only to type accepted equipment, and
certain notified transmitting equipment used pursuant to a station
license.

Equipment Class - Derived from the particular rule sections specified
in the rules governing the particular class of equipment.

Expiration Date - Applicable to certain types of equipment as specified
in
the Rules. Equipment cannot be manufactured or marketed after this
date.

Frequency / Frequency Range - The frequency or frequency range the
equipment
is authorized to operate. Pertains to all equipment with the exception
of Class B Computing Device Peripherals.

Frequency Tolerance - Pertains only to type accepted equipment, and certain
notified transmitting equipment used pursuant to a station license.

Grant Date - Date of Grant as specified on the most recent
authorization
issued by the FCC for the specified FCC Identifier.

Grantee Name/ Address - Name and address of the applicant as it appears
on Form 731 and as listed by applicant/grantee code in the Commission's
records.

Note Codes - Two character codes used for referencing specific notes
which
apply to a grant as issued by the FCC. Notes can be referenced in
the
Note Code Definition file on the main menu (Selection #2).

Original Grant Date - This field was created in June, 1985.
The
original grant date represents the date of the last grant issued prior
to
June, 1985, or the date of the original grant of authorization if
the
application was approved after June, 1985.

Power Output - Pertains only to type accepted equipment, and certain
notified
transmitting equipment used pursuant to a station license.

Receipt Date - Date of receipt of the application at the Mellon Bank in
Pittsburgh, Pennsylvania.

Related ID - FCC Identifier assigned to a companion application filed
simultaneously.

Rule Part - FCC Rule Part(s) under which the equipment is authorized to
operate.

MARKETING REGULATIONS FOR RADIO FREQUENCY DEVICES

A radio frequency device is defined in Section 2.801 of the Rules as any device which in its operation is capable of emitting radio frequency energy by radiation, conduction, or other means.

Section 2.803 - Equipment requiring Commission approval.

Equipment subject to Certification, Type Acceptance, Type Approval and Notification is required to be authorized by the Commission prior to marketing in the United States. Marketing means, "sell or lease, offer for dale or lease (including advertising for sale or lease) or import, ship. or distribute for the purpose of selling or leasing".

Advertising or display of a device requiring a grant, but has not been granted certification, type acceptance, type approval or notification will not be deemed to be an offer for sale, provided the advertisement contains, and the display is accompanied by a conspicuous notice as follows:

"This device has not been approved by the FCC. This device is not, and may not be offered for sale or lease, or sold or leased until the approval of the FCC has been obtained".

Any non-approved device displayed under the terms of the above provisions may not be activated or operated.

Section 2.805 - Equipment that does not require Commission approval.

Equipment which does not have to have a grant issued by the Commission, e.g.,
a device subject to verification, but must comply with specific technical standards prior to use, must not be offered for sale or lease (including advertisement for sale or lease), imported, shipped or distributed for the purpose of selling or leasing or offered for sale or lease, prior to

compliance testing to determine compliance with the administrative and technical provisions applicable to the specific class of equipment.

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the Commission's Rules regarding equipment that is intended to operate in various radio services in the high frequency radio spectrum, including "10-Meter" Amateur Radio Service (ARS) equipment.

The Commission has noted that a number of transceivers imported as ARS equipment are also capable of transmitting and are being operated in nearby frequency bands allocated to other radio services such as the Private Land Mobile Radio Services, Maritime Services, Auxiliary Broadcast Services, International Broadcasting Services, the Citizens Band Radio Service, and the U.S. Government. Operation of this equipment causes interference to the authorized users of these frequencies. Some of these <<<<read here transceivers are capable of using output powers or emission types which are not permitted for the radio services listed above and some are capable of transmitting in the radio astronomy band where no two-way radio communication is permitted. Some

manufacturers are promoting the sale of conversion kits, or have designed their transceivers such that they can easily be modified by the users, to extend the operating frequency range into the frequency bands listed above. In addition, so called "export" radios which are deliberately designed to facilitate this capability are also being imported and marketed.

Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type <<<<read here
accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use. The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required, because of the simplicity of modifying them to extend their operating frequency range. Transmitters designed and intended for use only in the <<<<read here
ARS must comply with the applicable technical standards contained in Part 97 of the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to: (1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio service(s) in which the transmitter is capable of operating; (2) <<<<read here
import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued; or, (3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission-issued station license. Violation of the Commission's regulations will subject <<<<read here
manufacturers, importers, vendors and users of this equipment to appropriate criminal penalties as provided for by federal law(s), including fines and/or imprisonment. In addition, the equipment described above can be seized by, and forfeited to, the government.

For further information concerning this Public Notice, contact Gary Hendrickson at the FCC Laboratory, 7435-A Oakland Mills Road, Columbia, Md. 21046, (301) 725-1585, Extension 223, or E-mail: ghendric@fcc.gov.

Good insights but why still play the role of a victim? To be liberated
from your past, you have to LET IT GO. Ten years from now, you'll hate
who you are today. There is no peace or healing going on when you
despise anything, past, present, or future. Its all INSIDE you - what
isn't there to love?

Peace and healing come with acceptance and forgiveness. Then you can love
instead of hate. Much better use of energy. In fact, the sensation is
that it takes no energy. What we resist (the pain of not loving) persists.

Hi Bob;

Thanks for the information. The cardboard tube assembly of 6 toroids
together with approximately 6 dipped mica capacitors and 2 or 3
resistors on an external terminal strip is exactly what I picked up. It
had no other ID. It was so heavy that I wondered what was inside. I
slapped the assembly on an oscillator and noted that it had a rising
characteristic with a fairly sharp peak at 13,200 Hz with Zin = 600 ohms
and the output unloaded. I have used the toroids many times over the
years, but I usually picked them up loose at hamfests or from Fair
Radio. I had never seen the assembly before, and I was surprised when I
unstapled the end caps and saw the old familiar toroids! I figured
someone would know what
the original intended application was!
Thanks for sharing you knowledge!

I also lost a battery in a TP500. Turns out you want to remove the
battery when you're using the AC power supply. Leaving the AC plugged
in for long periods of time will definitely trash the battery in this
unit. Charge for 1.5-2 hours to recharge the battery.

According to my dictionary:
PUERILE
1. Belonging to childhood; juvenile.
2. Immature; childish. See Synonyms at young. [Latin *puerlis*, from puer, child, boy.] • puerilely adv. •puerility or puerileness n.

Maroof,
You might want to look at the Motorola MC13030. This device is a dual-conversion AM receiver chip, and the advanced information that I received has applications that include AM broadcast, 5-10 MHz, and CB band.

I'm not sure how long this device will be available. The track record for ICs suitable for SW receiver designs has not been good, beginning with the ill-fated LM373 of many years ago, which had lousy dynamic range.

Myself, I us an FM IF device (NE604) as a synchronous detector and have had pretty good results using it in IMS applications, and recently put together a 40m receiver using an NE605 as the core for a single-conversion design. An NE605 with an NE602 first converter would make a fairly good dual-conversion scheme, but the mixers in both these devices have a less than desireable third-order intercept point, and therefore the topology is limited to hobby applications.

On the other hand, this series of devices (from Philips) has been around forever, and promises to continue being available, at least for the forseeable future. They are, after all, very basic building blocks for FM receivers and therefore lies their longevity.

Regards,

Chris

> > > a bad thing for packet.
> > >
>

Another proven way to speed up relay drop-out is to use a zener diode in series with a regular diode across the relay coil. The cathodes of both are tied together and the anode of the zener goes to the positive terminal of the coil and the anode of the regular diode to the negative terminal. For a 12 volt coil, a 20v zener is suitable. This arrangement will clamp the peak reverse spike to 21 volts or so.

I have used this technique on a Mocom 70 which measured 65 ms drop-out when using a regular diode spike suppressor and it was reduced to 15 ms (same as the pull-in time) with the above mentioned circuit.

A MOV surge suppressor of suitable ratings (18v or so) should also do the same job at somewhat higher cost.

Date: 1997-02-26 00:00:00 UTC
From: tim_hynde <tim_hynde@idecc.com>
Message-ID: <3314822C.1E75@idecc.com>
Source record: 96620

I want to take my 80m DC reciever and change it to a superhet.
Do the following steps make sense?

1. Use a mixer that gives me a 455KHz output separate from the existing rx.
2. Replace the tuned front end of the dc rx to a 455KHz filter.
3. Replace the VFO (currently running at 3.5 to 3.6 MHz with one that runs at about 452 to 458 KHz this would now be the BFO.

I am doing this because I want single signal reception and I though it would get me a litte gain too. I am a novice at this, am I missing anything in my conversion?

Can I use one of those 455KHz cans found in AM radios as the occ. circuit? I was going to outboard the BFO and not use the occ. on board the NE602 mixer. Someone said this was better. I picked 455KHz because I have a plethora of filters for this freq.

They were used for equalizing the response on phone lines. They
normally were mounted 5 at a time inside a tin can with the terminals
coming out on a cardboard strip along the side. There were also 44 mh
coils but they were not as common.

The max. input rating for the 8877 is 4000 volts at 1 ampere, or 4kW in max.. 4.5 kW out with 4kW in is 4500/4000 = 112.5% efficiency.

I believe it could work. although the apparent efficiency does seem a bit high to me. How about adding another 8877 to make the story wash a bit better?
>
> I have a "reject" 8877 acquired as a sample from my friend W6TC sometime

A Ni-Cr-Fe VHF suppressor in a VHF amplifier? Crazy. Ni-Cr-Fe is pretty
much death on VHF.

Does this guy sound like he has an agenda or what?
At this latitude we get secondary cosmic rays, neutrinos, gamma rays and
the like--but no cosmic rays per se.

> The immediate benefit accrues to the person who sold the nichrome wire (and

Tom,

FYI, the first broadcast transmitter that I worked on ... twenty
years ago used the 8877. It was a grounded grid final with a
4CX250 as an IPA. I can't remember if it had a half wave or
quarter wave stripline in the output tank but there wasn't a
supressor anywhere in the final. It would make about 4.5 KW output.

The crazy thing ran very well at 105 MHz ... one final tube ran for
more than three years at that station making 3+KW output (100 Meter
stick with four bays of antenna in circular polarization).

Of course, some would have us belive such a final would never work!

Having been in the broadcast business for more years than I care to think
about, I can not hold back any longer.

Joe, what you stated above cannot be. That exceeds the Eimac specs of the
8877 almost double.

I am amazed how someone would make such a statement, and that same person
be so critical of others.

People,
You are missing the point! The object of newsgroups is the free exchange of ideas and information, just like ham radio is supposed to be enjoyed. Not by ignoring peoples views just because you don't agree with them. That is what makes the United States of America GREAT!
Not censorship!
You don't like don't logon or turn off your radio.

Rh> kits and how to get in touch with them?

Rh> I'm just getting started in amateur radio and am thinking about
Rh> building the following:

Rh> CW transmitter or transceiver
Rh> Amateur transceiver
Rh> Shortwave receiver
Rh> Morse code practice kit

Hi Robert,
Start with the morse code practice kit, learn the code and
talk to us on the air. It's easier to get started buying
used equipment at flea markets and fixing it up.

There is a fair amout to build, just getting everything connected
up, even when you buy the pieces at the swap meets.
Such as your power supplies, antennas, etc.

Find an electronics store near you and ask where the closest
stores are that have these.

But in general, get yourself on the air first, before putting yourself
behind with a transceiver kit. There is no equivalent kit of the
quality of the old Heathkits because todays electronics technology
does not lend itself to cost effective kits.

No, but there are numerous smaller outfits selling electronics and ham
radio kits:
Ramsey Electronics (800-446-2295)
Ten-Tec (800-833-7373)
As well as many other vendors producing QRP transceiver kits, etc.

I highly recommend the Ramsey Electronics FX series VHF/UHF transceiver kits. (1-800-446-2295)
In contrast to your other response, these are fully functional FM voice (as well as packet) radios and, while lacking the polish and bells and whistles of other commercially produced units, work reasonably well and are fun to build and use. Their manuals are practically worth the cost of the radio. Unlike the old Heathkit days where the manual merely instructed you to install a 1K resistor between points A and B and solder it, Ramsey manuals have you build the project stage by stage and test and play with it at each stage, and you will know a LOT about radios and electronics by the time you get finished. As for the limited diode programmability, it is easy to add a row of DIP switches to one of the diode channel positions that will allow you to program ANY available frequency from the front panel (in binary, of course, but hey it works). Not only that but it is EASY to remotely control and program this radio from most ANY PC with an I/O port which allows you to scan, record, frequency hop or anything else you can imagine and program. I've controlled mine via a C64 and relatively simple shift register, used it mobile and lots of action on packet. It is a real kick for me to use the radio and casually mention "I built it". Very few people have built their own radios in this day and age and I commend you on your choice of honors project.
The only complaints normally registered about Ramsey transceivers are their receive audio quality and squelch action but mods exist to improve these. Also their kits often are a bit more difficult to align for full sensitivity and power output than the manuals make out, but I maintain they are a good buy dollar per performance wise. And, you'll NOT be afraid to dig into this radio to repair or modify it.

>It is your right to pass or not pass as you see fit. In general I agree
>with you Burt looks much worse for his posts. However if a sysop
>chooses not to pass anti ham propaganda that too is his right. After

Correct. I agree with and support this right. However, just because
you have a "right" does not mean you have to exercise it. After all,
you have a "right" to make a fool of yourself, too. Remember, power
corrupts, and once you start censoring what goes through your BBS,
you'll find all sorts of excuses to filter out anything that annoys
you.

>all you guys supply the time, equipment, location and expertise we all
>enjoy thus it is your foot ball and you make the rules. Most reasonable
>people would accept this but then Burt is not reasonable.

And if all the Sysops who find various things unreasonable start
killing them, the network collapses. If you don't want to be part of
a free-flowing information net, then you have no business setting up a
BBS on such a net. Put your little up-tight closed BBS off on some
peripheral channel, and lock out folks to your heart's content.

I repeat: It's legal to lock out folks like Burt (or me - it's
happened more than once) but it's not ethical, nor is it in the spirit
of Amateur Radio. It's hard to overemphasize the importance of this
principle.

Hint: How far do you think the Internet would have grown if it
catered to the same sort of censorship that some hams practice?

Before putting this (or ANY Ramsey transmitter) on the air, MAKE SURE
that you check it out on a spectrum analyser. Harmonic suppression is
often too poor to meet FCC specs (spurs all over the place), and there
are other design flaws (keying the TX before the PLL locks, That
annoying squelch thump, non-existant shielding, etc.

I'd strongly recommend the Ten Tec kit over the Ramsey; it's a
much better design, and much easier to build it so it works legally.

Ramsey is OK if you want a bunch of parts and a starting point for a
design, but be prepared to do some major redesign work.

Source record: 96635

I am looking into starting a small low power non-profit AM Broadcast Radio Station.
This station will be used as a platform for religions and educational broadcasts.
Day time programming will be primarily to aid in home schooling children.
Evening programming would be some what more diverse. I have been in contact with
the FCC and am in the process of collecting information and starting to put the application together.

I am now looking into finding or building a transmitter and would like any input on sources of low cost surplus gear or where I might find a schematic for a super stable Xtl controlled AM
Transmitter. This will be a community station so Power out would not be more then a few hundred watts, depending on what output we are approved for under the Licence.

Thanks
Tom KC7PMQ

From: Dave Riley <daveaa1a@ssih.com>
Message-ID: <3314B7DB.515D@ssih.com>
Source record: 96636

Well after a year of trying different schemes, here is what I find best/easy to accomplish..

Being close to Nantucket Loran 'C' I receive this frequency with a ferrite rod and coil/cap tuned to 100 khz. This signal has enough output to drive scope directly. (No pre-amp)

I then take my best 5 mhz oven, counted down to 100 khz. and use for scope sync.. Well i took a 10 turn precision pot and with voltage divider was ablt to go +/- 4 hz. at 5 mhz. Now i just sync manually and hardly ever need a reset.. System seems to be faithfully within 10-8th to 10 -9th..

I call it the POOR MAN's Cesium Clock.. Thanks to the taxpayers..

Any ideas??

I am sure it can be done, but at those voltages, the current handling capability of the supply will be severely compromised due to the large voltage drop across the pass transistors!

Does anyone out there have any information that would help me generate S-Parameters using PSpice? Any information, particlarly a book or an article in a journal, would be most helpful. I'm trying to characterise some MMIC devices and am not overly familiar with PSpice at the present moment.

That is not type acceptance, but rather, type certification. Two
completely and totally different animals.

I use Netscape and it's newsreader. Is there anyway that I can filter
out certain subjects/individuals from having them show up in my reader.
If not can you reccomend a news reader that has this facility.

I am not denying individual's right to blow hot air. As far as I am
concerned, their argument is lost at the outset by posting it to an
inappropriate news group anyway. This last posting reminds me of "Oh you
are so good at milking cows. I wish I could do it as well as you do."
The only problem is someone doesn't know a cow from an ass.

Thank you for your help with ther news reader.

This is a non-cell phone. This is a phone that you hook up at home
to a land line. It can transmit unmoded (if that is a word?) about
3000'. Just with real antennas beams about 2 mile point to point.
You can call 1-800-488-SONY just ask for service manual SPP-ER101 it
will take two week to get it. This phone cost 119 as Sears. The
shift is 27 Mhz on the cordless phone. It has some filter at the
fround end that can be replaced. You can still used the brick out of
you cell phone to amp the signed with not mod to the brick.

Just thing for 119+12+4 you have a two complete receiver/exciter.
This is a cheap as it comes.

>. . .

This would work, but. . .

Since you already have the tunable VFO, consider changing the VFO frequency by 455 kHz. Then add a 455 kHz IF and BFO after the existing mixer. (That is, use your existing VFO/mixer as the VFO/mixer rather than as the BFO/detector.)

Regardless of which approach you take, you'll need to add a filter to the receiver's input for image rejection, if it doesn't already have a reasonable front-end filter.

I recently saw a chap with a whole raft of Heathkit rigs and
accessories at his operating table. Im not sure what publication but
email me and ill see if i can find it. perhaps in the canadian amateur
mag. Sometimes you see someone advertising an unbuilt heathkit but not
very often..im sure there are collectors, on air on the web nets etc.

I am not close enough to do that. So, what I did was to tune my
synthesized
receiver to WWV, set it to ISB mode, and connected the two audio outputs to
my PC which is running a 11 KHz 65536 point FFT in stereo. Then I tuned
plus
and minus 50 Hz. Tune low and there should be 50 Hz beat on one channel,
tune high the 50 Hz goes to the other channel. Resoultion is 0.168 Hz on
the
FFT. Then I carefully adjust the ovenized osc (I let it fully warm up, of
course)
to get the same 50 Hz on both sides. Now the master osc, which has an
output
on the rear panel, is darn close to 5.0000000 Mhz.

Thoughts on this?

I believe you will need a type certified transmitter. You cannot
reasonably build it,
as you really want to spend your time broadcasting rather than going
through the
certification process.

Put a WTB ad in the for sale groups, these units are floating around.

2502. Re: Any way to rejuvinate Nickel metal Halide batteries?

One of the best articles I've read on this subject is :

"The Design of Low-Noise Amplifiers"
by Yishay Netzer, member, IEEE

in "Proceedings of the IEEE" Vol. 69, No. 6, June 1981

It's theoretical to be sure but is thorough and quite understandable.
Specs receive proper attention and specific devices are discussed.
Should be just what you need.

Alan

There were three or four editions of this book. The earlier ones were probably better in the theory department, since at that point SSB was so new that people wanted to know about it and the information needed to be included because it wasn't available elsewhere. The later editions were probably better in the construction department, since the equipment being described was fancier and more like what we are used to today.

I think the last edition had a copyright of 1970 or so. I don't believe that they published a later edition. So the equipment described is over a quarter century old at this point. Rather like WWII vintage equipment being looked at in 1970 in terms of state of the art.

If you are looking for SSB construction articles, you might do better to look in more recent ARRL Handbooks. The ARRL's Solid State for the Radio Amateur, though twenty years old, also included some SSB gear.

The ARRL SSB books never did include much in the way of receiving equipment. Of course, you could always find plenty of receiver construction articles in the Handbook and the other ARRL books.

Collins put out a book on SSB. Howard Sam's also put out a book on SSB. I also seem to recall a more recent book that was quite expensive on SSB, perhaps published by McGraw Hill.

CQ Magazine also put out a book on SSB in the late fifties. It is a mix of construction articles (and I had the impression they were less likely to be reprints from CQ) and details (including schematics) of commercial equipment from the era. Since it was put out early in the SSB cycle (in terms of more common useage, at least), it too does a good job on theory. This one also stands out since it's the only SSB book meant for the amateur market that I know of that included a section (though admittedly brief) on The Third Method of ssb generation.

One good thing about the early editions of the ARRL and CQ SSB books is coverage of using phasing to generate and receive SSB signals. The CQ book even includes a section on DSB including an adapter for adding sychronous detection to an already existing receiver.

Virtually all the contents of the ARRL books is made up of from articles that were originally in QST. If there was some specific article in one of the editions of the SSB book, you can get back issues (or photocopies if the specific back issue is no longer available) from the ARRL for a reasonable price. Though you would have to figure out when the particular article was published in QST first.

The point to all this is that if you are just looking for a book with details on SSB, there are other possibilities. If you need a specific article, there are ways of getting it without tracking down the book.

Source record: 96516

Wouldn't it be easier to use the mixer that's already there as your first mixer? Then, you don't have to move the input tuned circuit, and just shift the VFO frequency a little bit. Disconnect the audio amplifier from the output of the mixer. Put a tuned circuit there, or if you are using some sort of ceramic filter (or mechanical filter), you might be able to get by with just a resistor on the output of the mixer. Add your IF amp and detector (with BFO) and you've got it made. Of course, all of this depends on what you were using as the mixer int he direct conversion receiver. If you are using something that is commonly used as a first mixer, then there's no problem. But some of the simpler product detectors might work better by keeping them as product detectors.

Whether you change the product detector into a first mixer, or add a product detector afterwards just might depend on circuit layout. Look at the possibilities, and consider which requires the least effort.

Years ago, there was a series in QST that was about using semiconductors. It started out with a direct conversion receiver, and then later turned it into a superhet. Of course, since they planned it that way, they described the construcion in module format, so it was easy to make the changes later. Modifying an already existing receiver might be messier. In fact, considering the cost of semiconductors (thought those variable caps can be costly), it might be simpler to keep your DC receiver as it is, and just build a superhet from the ground up.

In more recent years there was a receiver in the ARRL Handbook called something like "The Progressive Receiver". I thought progressive in this case meant state of the art, but it turne dout to be built in steps. I think it originally was a QST article, and it did start off as a direct conversion receiver, and then turned into a superhet.

Another thing to consider is that with a 455KHz first IF, images may be a problem, depending on how good the front end filtering is. Images, of course, the same thing as the lack of single-signal reception in a DC receiver, except instead of the image being an audio frequency away, in a superhet it's twice the IF away.

One thing that I've considered doing to get around the image problem but still make receivers relatively simple (and I admit that this is only for simple receivers where top-notch specs are not expected), is to use a ceramic filter in the megahertz range, and make the receiver double conversion. It's done all the time in narrow band FM receivers, where the first IF is commonly 10.7MHz. You don't use the first ceramic filter for signal-selectivity, but only to get rid of the image created by the low second IF. The same scheme was used years ago in amateur receivers, though tuned circuits were used in the first IF. The ceramic filter

just makes it easier.

You can use a 10.7MHz first IF. Find an old CB set that is double conversion, and in many cases it does have a 10.7MHz ceramic filter, along with the crystal needed to convert to the 455KHz IF. In fzct, it should also have the 455KHz ceramic filter. You can also find similar filters in those cheap 49MHz walkie talkies (though make sure it is a superhet). YOu probaby would do better to use an AM specific second IF ceramic filter though.

I've also seen tv sets with 4.5MHz ceramic filters for the sound circuitry. You might get by with using that, and a 4MHz conversion oscillator (they are commony available) to get down to 455KHz. It depends ont he selectivity and shape of the 4.5MHz ceramic filter. If you end up too far down the slope, then you'll need a crystal on a slightly higher frequency, and if you have to custom order it, the scheme is hardly worthwhile.

JUst to be complete, you can have a superhet that is not single-signal. I seem to recall that the early superhets were not single-signal (well, I seem to recall reading that, I wasn't around back then). When direct conversion receivers were first in vogue, and I suppose to a certain extent now, it was common to make a DC receiver multi-band by adding crystal controlled receivers ahead of it. It didn't make the receiver single-signal, but it was easier than switching tuned circuits, and it kept the VFO stable by keeping it in a single relatively low frequency.

I wonder if anyone can help me with this little problem?

Is their a computer program that let's you input some simple figures like wire size, type of torriod (eg T50-6) size of former etc, and works out how many turns you need for a given inductance?

I mainly like to work with T-50 torriods but I have no idea how to work out how many turns to use for a given frequency or to use as an RF choke.

Also does anyone know the maximum power one can get away with using a T-50 as an output matching transformer in a VMOS FET PA stage. I read somewhere 25 watts but I'm not sure. If one wanted to go above 25 watts, what would be best torriod to use?

Regards to all.

Purchased the assets of a small company and ended up with several cabinets of 1/4 watt resistors, metal film and carbon film. In packages of 100. Every value you can imagine. Would like to sell a portion of these or even a few at a time. Cost would be 1/2 what the catalogs ask.

Also have a cabinet of tantalum capacitors:

10V: 33, 47 mfd
16V: 2.2, 3.3, 4.7, 6.8, 10, 15, 22, 33, 47 mfd
20V: 1.5, 4.7, 6.8, 10, 22, 33 mfd
25V: 2.2, 4.7, 10 mfd
35v:, .1, .68, 1, 1.5, 2.2, 3.3, 4,7, 6.8, 10, 15 mfd

have qty up to 10 of these. Brand new. Price also 1/2 catalog.

e-mail if interested in any/all.

> :>amplifier with less VHF not???

• Why?.....Because the anode-resonant circuit in a VHF amplifier IS the (loaded) tank circuit. In a HF- amplifier the anode is connected to TWO resonant circuits, one of which is obviously the HF tank. However, a virtually-unloaded VHF resonance is principally formed by the anode-to-grid C (typically 5 to 10 pF) plus the anode-to-enclosure C (typically 1 to 2 pF) and the incidental inductance between the anode and the tuning capacitor, C1. There is a large difference between an oscillaion in a resonant circuit that IS loaded and an oscillation in a resonant circuit that is NOT loaded. The Rs/Ls VHF parasitic oscillation suppressor is essentially an attempt to load the unloaded VHF resoant circuit in HF amplifiers, thereby reducing VHF voltage amplification.

Boy, I've seen them in lots of rigs and other mechanical devices, but couldn't tell you where to get them. You could easily make them out of plastic rod -- drill a 1/4 inch hole down the middle, then drill and tap some screw holes in the side.

I'll go a bit further, though, and tell you my experiences with this scheme. I used a kludged version of that tuner for some time (that is, no real good pulley connection between the inductors, just manually adjusted both of them). It looks neat and symmetrical, but you often can get good results without the second inductor -- that is, just hook your favorite unbalanced tuner configuration (in this case, a simple L network) across the output of the balun. If the balun forces balanced currents, it will force balanced currents no matter what is hooked up to it -- or nearly so, depending on stray coupling of the components to ground.

I have applied this approach to the SPC tuner circuit -- a more flexible, resonant tuner with a somewhat wider range of matching than the standard L net -- in a clipleaded-together high power version, and a compact QRP version.

The QRP version uses a ferrite balun on the input -- 3 turn primary and secondary on Amidon BN-43-3302 core. Haven't measured the balance scientifically, but I do know that when I bypass the balun, I get a higher noise level on my horizontal loop. I take that as evidence that this approach at least approaches the performance of a true balanced setup. Someday I'll get around to measurement and settle the question for me, anyway :-)

Good luck,

John Seboldt K0JD

2517. Re: Best Frequency Standard

From: William W Janssen <billj@9calweb.com>
Message-ID: <5f4abmoak1@news.calweb.com>
Source record: 96523

My frequency standard uses a stable crystal oscillator and a
devider chain to get a pulse rate that is the same as my nearby
LORAN transmitter. I use my pulse to sample one of the LORAN pulses.
The sampled voltage is fed to an amplifer/filter and is used
to control my oscillator.

I think I am getting accuracy of about 10^-10. I have had
trouble with phase delay changes in my receive equipment of about
20 nanoseconds. It seems to be better now that I removed a tuned
circuit from my antenna coupler.

LORAN has a faily strong signal in most parts of the USA. and
in many other parts of the world as well.

2523. Replacment mic element?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-27 00:00:00 UTC
From: adkinsg@piranha.ianet.net
Message-ID: <5f4kl1$859@piranha.ianet.net>
Source record: 96529
Cross-posted to: rec.radio.cb,rec.radio.amateur.misc,rec.radio.amateur.homebrew

Hi.

I have a TRC-484, and I've decided the mic is completly
crummy. I thought about replacing it with an astatic
or something, but I didn't really want to fork out that
much money, since the radio was only $50 to start.
Plus, the mic has channel up/down buttons on it, and
the CB is mounted far enough away for this to be very
helpful.

Are there any replacement mics that up/down channel
selectors? I cracked open the mic, and it's a simple
three wire circut. (i.e. center to left is down one
channel, center to right is up one channel)

I thought about just adding some small momentary switches
to a regular mic, but that becomes clumsy and looks bad.

Alternatively, I could just replace the mic element, I suppose.
I looked in an "All Electronics" catalog, and they only had
electret mics, and I was concerned about fitting a battery
and isolation circuits in the small mic case. (RS only
sells electret mic elements, too) I guess i could use
one of those strange T175 7v little batteries, it might
fit.

If i change the mic element to an electret, will I overdrive
the input circuits on the cb? This would probably be
the cheapest solution...

Thanks for any help!

Garry

2524. Receiver- kit for Weather Sat's (2)

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-27 00:00:00 UTC
From: abom@iaehv.nl
Message-ID: <3315d9a3.475925@news.iaehv.nl>
Source record: 96530

Receiver- kit for Weather Sat's (2)

Dear weathersatellite- fan,

A few weeks ago I announced a weathersatellite receiver- kit.
The necessary zip- file for building the receiver can be found on the
url of the technical university of Eindhoven in the Netherlands. The
URL- address is:
ftp://ftp.esrac.ele.tue.nl/pub/ham/wefaxreceiver-kit.
The VHF2_10.zip -file of about 125kb contains the next files:

VHF2.plt The complete schematic of the receiver in HPGL- format
VHF2.par The complete partslist of the receiver in ASCI- format
VHF2t.tif The topside of the PCB in TIF- format
VHF2b.tif The bottomside of the PCB in TIF-format
VHF2c.tif The componentlayer of the PCB in TIF- format
README.txt Some background information.

In about 4- 6 weeks a nice glass epoxy print with silkscreen lettering
will be available.
If you want to make the PCB yourself, you can start immediately with
copying the top and bottom layers to transparent sheets.
On this moment the assembly- instructionsheet is being prepared and
will be send as an attached .txt- file to those who are going to
build the receiver.
For changes that are essential for the design, I will direct- mail the
WX- receiver builders.

Important design changes will result in a new VHF2_X0.zip file.
Small design changes will result in a new VHF2_1X. zip file.

Remarks before building your own Wefax- receiver:

Keep in mind that building a receiver is not just a matter of placing
the right components in the right holes. The receiver should be
adjusted for optimum results.

After that I designed last year the Wefax- receiver it's now for me a
challenge to help others in building the receiver via the internet-
possibility and to help them in getting good results with "normal"
components and limited measurement- means. Further I hope to receive
sufficient feedback for possible new receiverextensions , like PC-
operation, synthesizer and scan-possibility, this could lead to a
new and more advanced design.

For more details, questions or problems during assembling your
receiver, you can contact me via E-mail : abom@iaehv.nl or

pa0axb@amsat.org.

Succes in building your own Wefax- receiver!!!!

,

Alex Bom

Allow me to extrapolate here for a moment.....

If I read this correctly, If a transceiver is designed to be easily modified, then it must be 'type accepted' (or approved or what-ever) before it can be marketed and sold. That would lead one to believe that if buy a radio that can have its coverage extended mearly by removing a jumper for instance, then it should already be 'type accepted' for that use. Otherwise, it could not be marketed and sold.

Continuing, (and recapping,)

> It is a violation of the Commission's regulations to: (1)
>import or market a transmitter that is designed or intended to
>operate on frequencies outside of the ARS bands, if it has not
>been issued a grant of equipment authorization for the radio
>service(s) in which the transmitter is capable of operating; (2)
>import, market or operate a transmitter that requires a grant of
>equipment authorization but for which no grant has been issued;

OR,

>(3) transmit on a frequency allocated to a licensed radio
>service without the appropriate Commission-issued station
>license. Violation of the Commission's regulations will subject
>manufacturers, importers, vendors and users of this equipment to
>appropriate criminal penalties as provided for by federal law(s),
>including fines and/or imprisonment. In addition, the equipment
>described above can be seized by, and forfeited to, the
>government.

As I read this; if I have a modified transmitter, and I'm operating under a valid business license, then I'm OK because of the giant word OR between #2 and #3.

How do you interpret this?

BTW, thanks for the great post. Finally, some real information

What you mean is a "Crystal Set", search the Web for such and you will
find a nice crystal set site, giving construction details and info
about books etc. Very simple really, just a parallel coin and
variable capacitor with a GERMANIUM diode and high impedance
headphones. And a good aerial and earth. There are endless
configurations to experiment with.

I imagine you could find at least one of them right here in this
newsgroup, or at least one or more of the first small group.

>imagine that the intent of the first link of the 'packet network' was
>to forward information, not garbage. Keeping the network free of
>garbage reserves valuable space for valid information to be passed.

Nonsense. One man's trash is another man's treasure. Who appointed
you arbiter of what's garbage and what's not?

>The amateur packet radio network already forwards, by design, an
>incredible amount of garbage in the form of message headers. I

At one time, those were mandatory. They still contain an amazing
amount of information essential to maintaining and troubleshooting a
network. Yes, they could be streamlined. So could a lot of other
things.

>that garbage a totally unnecessary ASCII drawing at the end of
>every message, a few lines of advertising from the guy who wrote
>the whiz bang terminal program used to generate the message, and

Yes, those are wasteful. But that's a separate issue, unless you
decide that you aren't going to forward anything by anyone who uses
ASCII in his signature.

>network does a wonderful job of diseminating garbage, but unfortunaly
>falls flat on it's face when it comes to delivering mail from one ham to
>another ham.

That's why we have the Post Office and the telephone. Of course, if
sysops were doing their job instead of worrying about censorship and
power trips, it'd work a lot better. In fact, it DID work better
several years ago than it does now.

>I agree one hundred percent with Steve. I supplied the two computers,

>the Happy Club. Steve chooses to keep certain people off his system.
>I choose to keep certain garbage off my system. We are both doing
>what we are supposed to be doing, monitoring and eliminating garbage.

You're both part of the problem, not part of the solution. You have
no business setting yourselves up as arbiters of what's garbage and
what isn't. If everybody did that, there'd BE no packet network. If
you want a closed net, be my guest. Forward to *each other*, sans
"garbage." But don't pretend to be part of an open, global BBS
network, because that is NOT in the spirit of Amateur Radio.

>My packet equipment isn't a 'public service'. It's a service provided for
>hams to use in relation to ham radio. Bible banging and birthday lists

No, it's an ego trip that allows you to force your decisions of what's
"right" or "wrong" on your fellow hams.

>have nothing to do with ham radio, so I make the decision to keep that
>junk off my system, and not contribute to the confusion by sending it
>to other systems.

You're a disgrace to good sysops everywhere.

>When you, TAPR, or the ARRL decide you would like to reimburse me for
>the cost of my equipment and start sending me a paycheck, I will be
>happy to revert to your system of not excluding anything from my BBS.

When folks like Burt get their way, thanks in large part to attitudes
like yours, I hope you'll be very happy with your commercial station.
Of course, if you had to compete with commercial stations, you'd be
out of business in a week, since the real world has little tolerance
for censorship and ego trips.

O. I C. The packet 'network' isn't for forwarding mail from one ham to another.
It's a digital soapbox for Bible Bangers and Birthday Clubs. Thanks for letting
me in on that secret. Next time I see someone put NTS traffic or a personal
message on the BBS here, I'll kill it and tell them to use the telephone.

You appear to be of the 'forward it anywhere and my job is done' mentality.
No wonder you'd rather forward bulletins than personal mail. ANYPLACE
is the right place to forward a bulletin. Personal mail requires a bit of
work .....

>Don't teach your grandmother to suck eggs. I've done all that stuff,
>and more.

Well, since you have already taught your grandmother to suck eggs,
I guess we can have her teach mine, but if you want your grandmother
to teach my grandmother to do anything, tell her to bring a shovel, cuz
she's gonna have to dig my grandmother up before she can start class.

There is no such thing as a global Amateur Radio BBS network. There
never has been, and there never will be. Unless, perhaps, if you define
'global' as a hundred miles in any direction of your house. Most of us
who don't live in the United States Of Drug Dealers use the word
'global' to mean the ENTIRE world, not just the little part that you live
in. If you have fooled yourself into thinking there is a 'global' packet
network, send me a packet message with your phone number in it and I'll call you
when it gets here: KH2D@KH2D.GUAM.USA.OC

Don't bother staying up late waiting for me to call.....

>>My packet equipment isn't a 'public service'. It's a service provided for
>>hams to use in relation to ham radio.

>No, it's an ego trip that allows you to force your decisions of what's

Now I'm on an ego trip. OK. Didn't you just tell me "Don't teach your
grandmother to suck eggs. I've done all that stuff, and more. "

>When folks like Burt get their way, thanks in large part to attitudes
>like yours, I hope you'll be very happy with your commercial station.

You lost me a bit here, I'm not sure what 'Burt's Way' is, I thought this
discussion originated because you were upset with the fact that Burt's
mail was being kept off Steve's system. I'm not here to compete with
commercial stations. I'm here to enjoy ham radio. But you're right.
Nobody gets fired when the operator of an Amatuer Packet Radio BBS
runs around patting himself on the back yelling 'I'm a SYSOP ! I'm a SYSOP !"

while the mail is getting forwarded to La La Land. And judging from
the amount of mail that goes to La La Land, it's a good thing, because
a lot of 'sysops' would be out of a job.

I think we have found the problem here, Glen. You don't seem to have
a firm grasp of the definition of the word 'network'. Networks don't
collapse from lack of traffic, they just move the existing traffic much
faster.

I did not copy a graph. I made the Rp graph with ClarisWorks, using 2 of the 46 columns of copyrighted measurements.

Mr Stewart's statement regarding LICKING of what appears to be private parts, leaves little doubt in my mind that his interest in helping amateur radio operators LICK VHF parasitic-oscillations was, and is, secondary to helping Mr. Rauch defend his self-appointed, self-annointed title as one of our 'recognized amplifier experts'.

IMO, people who have a general understanding of AC power amplifiers do not reject AC Circuit-Analysis---as we have witnessed from Mr. Rauch and a number of his supporters..

The denouement of this debate was November 28.

(I'm always suspicious of flames such as above when the author fails
to include any of the remarks he's disagreeing with. It usually
indicates he has no defense, so instead he insults.) What portion of
Dana's statement do you take issue with, Bill? As I recall, Dana's
concern with taking an amateur radio and using it out-of-band was
in regard to the freq'y agility of such radios. It's a very valid
concern.

I've already pointed out why someone shouldn't use an amateur HT
for fire service communications; its freq'y agility and non-resistance
to the heat of fire were two main points that caused me concern
(I had a portion of my helmet melt in one structure fire - can't
imagine any amateur HT being able to survive such heat, but commer-
cial radios *will* be able to withstand such temperatures).

Let's supposed someone wants to use their 2m HT in the marine band.
Most boaters know that they can contact the Coast Guard on ch. 16.
But what's a channel designation mean to someone whose HT only
reads the freq'y of operation? Suppose you have an emergency and
the USCG tells you to shift to channel 22A? Or channel 12? Those
designations are useless to someone who doesn't have a channel-to-
frequency chart in their hand. Bridge-to-bridge comms are supposed
to be done on channel 13. What freq'y are you going to set your HT
to? The marine operator just asked you to shift to channel 83 for
a phone call. What freq'y is that, Bill? Are you going to commit
to memory all 80+ or so frequencies/channel numbers?

You're sore because we've presented some valid reasons (aside from
the legal issue) for not using an amateur radio for out-of-band
service. Don't be sore - just open your wallet and *buy* the proper
radio for your needs.

Jeff KH2PZ (former fireman *and* former Coast Guard radio officer)

:>I suspect--correct me if I'm wrong--that the transmitter was actually
:>a 2.0-2.5 kW output unit with a station ERP of 5 KW, a typical Class
:>A arrangement.
:>

It was a McMartin 3 KW transmitter and our licensed TPO was just a bit above 2800 Watts as I remember (this WAS 1976). Class A stations were 3 KW ERP at 300' in those says, not the 6 KW at 100 Meters as is the norm today.

I had one night a week when we were off the air (Sunday night). One Sunday night another college ham buddy and I decided to see just how much power we could get out of the box ... (we knew full well we were exceeding Eimac's ratings but I had a good spare tube and didn't know any better) ... we tapped the plate primaries all the way down to get about 4500 Volts of HT and cranked the drive all the way up. It made about 4450 Watts and we didn't run it very long. However, I did make regular meter calibrations at 110% of licensed power (3050 Watts if I remember correctly).

The tube was almost a year old when I got there ... I did not have to change it in the year I was at the station. The guy who followed me commented about replacing the final about a year after I left so I assumed it was the same tube I was running.

:>It seems that the original price on the 8877 was less than $150; the
:>8873, 8874 and 8875 were $37.50 each when they came out.

I noticed those prices ... the 8875 was < $200 when I did the budget at that station (yes, I did budget for a replacement ... it's good practice ... even though I had a new spare). I would like to find the tubes at that price today <G>!

: U. S. Copyright Law provides for 'fair-use' quotes of excerpts from
: copyrighted materials---provided that credit is given to the copyright
: holder. It would be a violation of U. S. Copyright Law NOT to give Mr.
: Wesley D. Stewart, Jr. credit for a fair-use quote of any part of his
: copyrighted materials.

I am not a lawyer, but what the university administration here has communicated to me about fair use of copyrighted material in classes is:

1. I can make a copy of, for example, a figure or graph from a copyrighted source and show it to my class (with appropriate credit of course) to demonstrate a point in my lectures. This is considered fair use.

2. They specifically tell us that we cannot, for example, scan items into our computers and place the files on web pages available to the public. This is considered publication and is not fair use. So if I put a copy of my lecture notes on a public web page, I must leave out material for which I don't have a copyright unless I have prior written permision.

3. If access to a web page is restricted i.e. it requires a user name and password, and only my class is given access, other rules can apply.

First it may be easy to remove a jumper it is just the problem of which
resistor or diode to remove that makes it difficult. Also by using your
logic you could argue robbing backs is not agaist the law if you don't get
caught. Seriously there are legitimate uses for amateur radios that
transmit out of band such as use by people with valid MARS license and also
many amateur operators use HF radios to drive vhf/uhf transveters and never
transmit on frequecies where the radio must be type accepted.

Gee I hope your not a lawyer or logic designer. Let me write this a little different.

Fine and/or jail = operate a transmitter that requires a grant of equipment authorization (for the band your transmitting on) but for which no grant has been issued OR transmitting without a licence on a band that requires a licence.
Have fun. Good hamming.

If you don't find a Drake replacement transformer (have you tried
calling Drake? - They have moved recently, so you will have to get
their new phone number) try the Peter W. Dahl Company - they have a
web site, but I don't have it bookmarked - you can find it thru Yahoo!
or any other good web search engine.

Good Luck!

You may be able to work it out. I am not familiar with the 8295A, but if you use a similar technique to that you would use with an unknown transistor you should be OK.

Identify the heater first with a multimeter. You should then be able to find the cathode - if not directly connected to the heater, the capacitance betweeen them will be greatest.

Once you know those two electrodes, apply heater volts and a few 10s of volts will allow you to figure out which is the anode, and which grids are which.

>

Hi, Dick,

From the symptoms you report my experience says you have a bad cell. That seems to be the leading cause of what has been misinterpreted as a memory effect.

I have been very succesful with repairs to such batteries, but it does require getting into the innards and replacing the bad cell. That is not always easy unless you have some decent small tools and some courage. It is also nice if you can minimize the cosmetic damage, which isn't always easy. The manufacturers don't design the packs for service.

If you would like some more specific info let me know.

> ARRL handbook! I have gotten them from the library and they seem more
> geared toward someone who:
>
> A. Has a ton of time
> B. A ton of money
> C. Wants to buy _their_ kits!

I have seen tables every now and then but can't recall where for the moment.

Quickies for air wound solenoid coils I'm using are:

L=(0.008*d^2*n^2)/(3*d+9*l) single layer
L=(0.008*d^2*n^2)/(3*d+9*l+10*a) multilayer

where d=average diameter
l=length of coil
a=radial thickness of winding (multilayer)
n=# of turns

All measures are in millimeters. For inches, replace 0.008 with 0.2032. The resultant L will pop out in microhenries. Average diameter is diameter to the center of the winding, for single layer it's simply inner diameter + wire diameter.

For maximum Q, let l be 2 to 2.5 times d. The coil diameter should be more than 5 times the wire diameter. As for the wire gague, well, use the largest diameter wire that fills up the coil or for higher freq's wind with one wire diameter between the turns.

The formulas works rather well for coils from 0.1 microhenry and up. I usually hit within 5% with the single layer version.

The formulas are a mess to use if you don't have a computer. I wrote an Excel spreadsheet where I can play around with the variables until I have
what I want. Believe me, it reduces the calculation time a lot.

If you want a tunable coil... well, VHF coils can be trimmed by
spreading
or compressing the winding. Coils with an adjustable core are a real
pain
to calculate even if you know the properties of the core material. But
basically, with an iron powder slug, I usually try a coil with 5 to 10
times lower inductance with the formulas above. With ferrite slugs, much
lower. Don't expect the first coil to hit the target...
>

2563. Hi, looking for VFO gear mechanisms...

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-02-28 00:00:00 UTC
From: Kari Back <Kari.Back@karttakeskus.fi>
Message-ID: <33167AA6.3EE4@karttakeskus.fi>
Source record: 96569

Hello all,

I am trying to find two good quality, spring-loaded for
low backslash, 10:1 or greater VFO gear drives for HF
receiver/transmitter pair
(there is need to mount a dial plate to the low rotating
side of the gear drive)

These seem to be difficult to find nowadays, but if someone
had some info where to ask, would be great.

Thanks in advance

please email to
kari.back@karttakeskus.fi

I am wanting a plate transformer, 115-230vac dual primary, 2600-3000vac secondary @ 1amp minimum. Also want oil filled capacitor 25-50uf 4kv. If you have an xfmr or capacitors near the values listed, I'd appreciate hearing from you. Thanks John

The short term stability of GPS itself is only 5 x 10^-11. You have
to average for a whole day to get down to 10^-11 and that only works
well if your oscillator has low aging AND you measure the aging and
factor it in. High end crystal oscillators typically age 10^-11
per hour. The cream of the crop of these will age at least several
parts in 10^11 per day. And of course for 10^-11 to mean much, the
short term stability of your oscillator should be parts in 10^12, which
only the best oscillators do. Finally, you would have to compare
your standard against a cesium frequency standard (or maybe a very good
rubidium that has just been calibrated) to be sure you have everything
working at that level. I wouldn't describe that as "pretty easy".

You may find these difficult to find but try:

Radio Data Charts
R.T.Beatty revised by J McG Sowerby
Published by IlIFFE back in, I think, the 1950s.

These or similar ABACs give simple graphical solutions to
single/multilayer coils. Heaven knows where you might find one these
days. I got mine from my father and it has a sheet stuck in the front
for making your own transmission line calculator by building a
specialised slide rule dated 1944. I asked him but he didn't know when
he bought it.

If you can find one of these then they are a god send so try ordering
something from your library. They may have something in their reference
section.

hi Steve: i can probably give you a few tips. I have been studying
books such as w1fb qrp notebook and solid state design for the radio
amateur..these two i would recommend and to answer your question on
rf choke..mostly these are to suppress all rf from getting into or
onto the dc voltage supply lines to the circuit(s).since they have
to suppress the whole spectrum of rf they are generally wideband
devices and the torroid cores often used are ferrite such as material
43 ie t-37-43 the full p/n . for an amp above 25 watts say up to 50
watts you could probably use the next size up from the "50" size
torroid say the t-68 series and maybe for pennies more the next higher
one up from that say the t-80? or whatever it is. Anytime you build
something it helps to get ideas from established similar designs. Since
torroids are scarce and expensive up in canada i will often try to
avoid using them if i can. I use them sparingly so as not to deplete
my junkbox too quickly..if you have any furthur questions please feel
free to email me ...earlve3ab@igs.net

>
>Anyone have any experience for a good source of quality crystals?

Colour-burst crystals (NTSC - 3.5794545 MHz and PAL - 4.433619 MHz) are
cheap and can be used to build very effective CW filters. Higher
frequency crystals are better for SSB. It's best to buy, say, 10 of
them, and select those that have the closest parameters for the filter.
You can buy good quality crystals suitable for ladder filters from
crystal manufacturers (such as IQD here in the UK), but they are quite
expensive, and they usually have a minimum order charge. However, since
they will have tightly controlled parameters, you don't need to select
them.

Source record: 96577

A QEX article by J. Makhinson several years ago recommended Fox 8.000mhz microprocessor crystals. Supposed to be able get quite a few Q=150k out of a batch of 100. Mouser sells these.

I used to buy 9.000mhz from Hosfelt, but they are all gone. These had Q=120k consistantly, so I didn't have to pick and choose. Maybe the'll show up again.

Here I thought I had struck a goldmine last summer when I bought boxes full of microwave FDM boards containing hundreds of 250hz and 3khz Motorola crystal filters. The 250hz units contained discrete crystals, but sadly their Q was in the 50k range. The whole filter would be good for CW since it is some linear-phase type or similar response.

The 3khz contain cascaded monolithic filters. Several friends are using these as roofing filters in ultra-high dynamic range receivers using H mode mixers, and quadrature hybrids. I believe the filters were tested in UK to have intercept greater than +50dbm. Again I think these are linear-phase also.

I believe all the filters are resonant at 5.2mhz or thereabout.

I am mentioning all this since all these boxes are taking up space in my closet, and it might be good to desolder the filters and sell them. But I'm not too thrilled about being in the mail order business.

HELP*
I've got a new-to-me TS-430 that looks like it has had a number of mods done to it, and maybe some undone. I'd actually prefer it to work as designed; at least until I'm more familiar with it.

My biggest concern is that the VOX and Send/Recv switches have been somewhat bypassed when in CW mode. Even if the VOX is on manual and the standby is on Recv, when you hit the key you're on the air. I've noticed that when you switch the mode from SSB to CW the frequency display goes up by 800Hz.

I've opened up the radio to look for any obvious mods. Unfortunately, there are so many components on the bottom (solder side) of the RF board that I'm not sure where to start. The only definate thing I have to go on right now is that PD wire coming into connector 9, and the WRC wire coming into connector 10 have been cut.

I'd sure love to hear from someone that has some experience with these radios that wouldn't mind walking a newbee through some of this.

Thanks,

Jeff,

I'm agree with everything you say except one point and valid it is.As far as an amateur HT not being able to withstand extreme temperature changes such as fire I can only say one thing.Being in the two-way business for almost 10 years I have seen many commerical versions not survive fire any better then a fireman carrying his personal amateur HT.Also the case on the COMMERCIAL Vertex VX-10 is identical to that of any Yaesu ft-10,40 or 50.I know, I've had them both apart.The ft-10 and VX-10 are identical except for programming in the micro.

2583. Ground Rod Installation w/pipe

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-01 00:00:00 UTC
From: vincebucc@aol.com
Message-ID: <19970301124800.HAA18201@ladder02.news.aol.com>
Source record: 96448

I am in need of installing a good ground rod system at my station. I have never used anything other than the electrical ground in house wiring, but with these newer solid-state, IC-impregnated radios, I think it is best to have a good earth ground, not to mention safety requirements also....

A friend has suggested that I use a piece of pipe, about 3-1/2 to 4 feet in lenght to hammer a rod into the ground. He has suggested that black Carbon Steel SKED 80 (preferred) or SKED 40 be used with a suitable cap at one end. The 2-inch diameter pipe is to be slid over the pipe to take the impact of hammering.

I am not familiar with the term SKED 80 to describe the pipe. I believe that it identifies the wall thickness, but am not sure.

Where might I locate a source for pipe of this type?
What kind of expense should I expect for this pipe? Is it available in short lengths?
Has anyone used this method to hammer in a ground rod?

Any other methods or hints?

tnx es 73s,
WA2RSX

C.B. Radio modification manual covering over 200 [closer to 300]
different C.B. models.

Manual covers:
Increasing Transmit Power
Modulation Adjustments
Converting Clarifiers to Sliders
Channel Expansion
PLL information
Pre-Amp information and schematic
and More....

** Comes with a 1.44 Meg diskette [IBM format]
with PLL Pinouts, pinout viewer software.

$14.95 (plus $1.50 s&h)

Pipe "schedule" does define the wall thickness. Sched 40 is "typical"
water pressure pipe. Sched 80 is heavy wall.

Would strongly reccommend you go to a building or electrical supply
house and get "real" ground rods. They will be 1/2" diameter, 8 feet
long - either galvanized steel or copper clad. Also get the wire clamp
made to connect the ground wire (keep short as possible). Be sure to
put the clamp on the rod prior to driving in ground. Mushrooming of the
rod can keep the clamp from sliding on later.

Better grounding can be achieved by using multiple rods, fairly close
together (few feet) and bonding together.

I have driven into ground using stepladder and sledge hammer, but isn't
easy. A driver made from a piece of heavy pipe with closed end, slid
over (and slammed down on)the rod is easier. A sledge will be needed
for the last few feet.

Much, much easier is a heavy duty impact machine... Like an "electric
spade" or large "Hilti Drill". These are expensive, but if you can
borrow or rent one, it is worth it. Remove the "bid/spade" and slipe
the gnd rod in.... drives into most ground in minutes with no effort!

Pipe schedules are a pressure rating. In a given pipe material, higher
schedule ratings tend to correlate with heavier wall thickness.

> Where might I locate a source for pipe of this type?

Users of pressure pipe, such as steamfitters, would have it.

> What kind of expense should I expect for this pipe? Is it available in
> short lengths?

It is expensive, and it comes in 20 foot lengths. You could get someone to
cut you a short piece, or sell you a bit of scrap.

> Has anyone used this method to hammer in a ground rod?

I've used that method in very rocky soils. Weld a pair of handles to the
pipe, and pour it about a quarter full of lead. You want to end up
with a pipe about 3 feet long weighing about 20 pounds Slip the pipe
over the rod, and lift and drop, lift and drop until the rod is driven
into the ground. The lead fill adds weight, and provides a soft enough
driving surface not to mushroom the head of the rod.

> Any other methods or hints?

YES! There are much better methods of sinking a ground rod in most soils
than pounding it in. The method I usually use in clay soil is to dig a
hole about the size of a quart mason jar with a tile spade or posthole
digger where I want the rod. I pour water in the hole and push the rod
into the center of the hole as far as I can (usually only a couple
inches), and then make like I'm churning butter. Every foot or two,
remove the rod from the hole and add a bit of water. In less than 5

minutes, an 8 foot rod can be sunk this way with very little effort at all. Let the mud in the hole dry completely before backfilling the hole. It will sink back down the shaft and form an intimate seal to Earth with the rod.

This is the easiest and fastest method to set ground rods I know of short of using a hydraulic ram. In very rocky soils, you may need to pound a bit to break the rock impeding your progress. In less rocky soils, it is often easier to start over a bit to one side rather than trying to shatter the rock by pounding.

A good test is to use a high value 1/8 watt resistor, perhaps 10k ohms
or so with a very short lead connected to the base.

You can watch the base voltage on the other end with a meter (or
better yeat a scope with a low pass filter on the input) as you apply
drive. The voltage must hold steady (within a few percent) as drive is
varied.

Ian and I are in total agreement. Bias current required in a
non-active regulated bias system, unless the transistor has VERY high
gain at full drive, often approaches the collector current !!!

For ATV or other linear applications with peak powers of more than a
few watts an active regulator is the ONLY way to go.

That's a terrible analogy, Mustang. It's more like every article that
comes across one's newsreader *does* end up in one's grocery cart,
and we have to pick it and toss it out. It's simple to say "Just
hit the N key" but consider the costs involved in transmission and
storage of the garbage. It's better to just use restraint.

Why did this topic appear in r.r.a.boatanchors? - haven't seen any
insults in here at all.

I've seen copper-plated steel ground rods in a local electrical shop. I
think they were about 4' long. You can probably find something similar.

A method of getting ground rods into the ground that I saw mentioned
somewhere is to pour water into the hole. You hammer it in a bit, pour
in some water, wait for it to soak in, and keep repeating the process.
Apparently, it goes in very easily. I haven't tried it, myself.

Steve Simpson (Steve@chubs.DEmon.co.UK) wrote:
: Is their a computer program that let's you input some simple figures
: like wire size, type of torriod (eg T50-6) size of former etc, and works
: out how many turns you need for a given inductance?

: Steve "Chubby" Simpson

You can find all this data in the ARRL Handbook and some other homebrew reference sources. You have to know the A(L) value -- inductance per 100 turns or something like that -- then plug that and your desired inductance into the formula.

Computer program? Use your handy dandy spreadsheet. I have a big spreadsheet of computations in Excel 2.2 on my ancient Mac and all these calculations are a snap after some initial headscratching to enter the formulas. Even early versions of such software can do a "table lookup" function also, so you can have all the data entered once for a number of toroid types and sizes.

Good luck

: n=# of turns

: All measures are in millimeters. For inches, replace 0.008 with 0.2032.
: The resultant L will pop out in microhenries. Average diameter is
: diameter to the center of the winding, for single layer it's simply
: inner diameter + wire diameter.

The one I've always seen, for inch measures and using r for radius
instead of d for diameter, is

L = (n*r)^2/(9r+10l)

Thought it would be interesting to see how this compared with what
Jan posted. His can be rearranged to:

L = (n*r)^2/(7.382*r+11.072*l)

The result is identical for a coil with l/r = 1.508, and within about 5%
for coils up to twice as long as their diameter; the formulas agree
within 10% for "infinitely" long coils. For short coils, they agree
within about 3% down to length equal to radius (rather a stubby coil),
and within 10% for length only 40% of radius (20% of diameter).

Comparing each with another much more complicated formula which I
believe to be more accurate, Jan's formula is closer for short
coils (l < r, approx.) and the "9r+10l" one is closer for longer
coils. But either should be just fine for normal amateur work.
Always expect to trim coils (or tune with variable caps) a bit in
applications where the value is critical, such as in tank
circuits...inductance drops in the presence of shielding, and
stray capacitance can mess you up.

I've seen things in ham magazines suggesting that these formulas
don't work well for small coils, things in the 5mm diameter range and
smaller. But physics tells us that if you scale all dimensions of
an air-core coil, the inductance will scale exactly linearly with
size, which is just what both those formulas give as a result. I
suspect any "errors" have to do with parasitics (like capacitance)
that weren't properly accounted for.

Instead of making your own driver out of schedule 80 pipe, you can go to a farm supply store (or a hardware store in rural areas) and pick up a steel fence post driver, probably for under 20 dollars. However, you still need to do the final bashing with a heavy-duty sledge because the fence post driver overlaps the ground rod by about 18 inches.

For Sale...
I have 2 Heathkit ID-5001 computerized weather stations
for sale.

The first unit is still in kit form. The second unit is built.

This station is capable of measuring wind speed, direction, temperature,
with optional
indoor/outdoor humidity sensors, RS-232, and rain guage.

The built unit has no sensors, and the kit is missing a couple minor
parts that can be obtained at any electronic store.. Either combine the
2 units to have one working, which means you have spare parts or
purchase the missing sensors, and have 2 working units..

The reason for selling is MOVING...need the bucks, otherwise they
would never leave the shack!

No reasonable offer refused...

One of the things you can do with dual cable (75 ohm video) is use it as open
wire line. Simple feed the two center conductors and do nothing with the
shields of either cable. Advantage is you can have open wire line capability
without worry about it laying on the grond or touching some object. A friend
of mine uses it to feed his 40m yagi with a KW and it works fine.

'Grif' w. keith griffith <kgriffit@wolfenet.com> wrote in article
<33162484.60FB@wolfenet.com>...
> Somebody give me an understandable description of the Weaver method of
> generating single sideband? (Little or none calculus or above!)
>

Mix audio baseband with I and Q (0 and 90 degree phases)
of a tone that falls in the center of the source baseband spectral
response.

(i.e., for a 300 Hz -> 3kHz source signal, at 1650 Hz)

This produces a "folded-over" copy of the signal that extends from
DC to 1350 Hz (the signal of interest occupies ((3000-300)/2) Hz)
and an image further up in the baseband spectrum ... (assume good
rejection of direct feedthrough.)

Low pass filter both I and Q channels at ~1350 Hz to eliminate all
but the desired "folded over" copy of the desired signal energy.

Mix both I and Q baseband signals with I and Q of a *channel-center* RF
or IF carrier.

Sum the outputs of the mix in the preceeding sentence. The phasing
of the I and Q carriers in the two mixes determines whether the summed
signal is "upper" or "lower" sideband ... I use the "quotes" because,
unlike other methods, the suppressed carrier is not positioned above
or below the "sideband" but in the exact center of it ... with this method,
both the "upper" and "lower" sidebands occupy *exactly the same*
spectrum. This provides the sytematic advantage that imperfect
suppression of the undesired sideband does not splatter the adjacent
channel, but only causes a modest increase in the apparent level of
distortion in your recovered signal.

If your mailer supports MIME attachments, I can send you a block
diagram.

I own a patent on an extension of Weaver's technique which
adds to the architecture in a way that allows the carrier to re-inserted
in a controlled fashion to be used as a "pilot" and provides a fully
"feedforward" AGC/AFC capability that allows the companion receiver
architecture to effectively regenerate "faded" signals to the "unfaded"
state, removing the adverse effects of the multipath channel and
allowing SSB-like techniques to be applied in the mobile multipath
environment well into the low microwave region.

Of further benefit is the fact that the same architecture also permits
full, backward-compatible interoperability with FM and can "do"
a number of digital modulation modes as well ... also with the
inherent correction for the multipath channel impairments which
typically degrade BERs to undesirable levels ... and at far higher
data rates than previously practical in mobile systems ... a major benefit.

Ooops ... my last two paragraphs are beginning to wander a bit beyond
your original question, but I hope I've been helpful.

>100 ma should be fine.

That depends on the RF generated base current of the transistor. If
the base current is 10 mA at full drive, 100 mA of standing current in
a shunt device connected directly from the base to ground may be
enough.

With less than several times the RF generated base current standing in
the component or device shunting the base to ground, bias will move
all over the place with drive. The only devices over a peak power
level of ten watts or so that I've seen remain linear with a siple
divider are FET's.

Just because the PA is biased in linearity at zero drive does not mean
it stays there, especially with high peak to average powers like fast
scan TV.

The bias voltage has to remain stable under maximum drive conditions,
when the beta of the transistor may fall to as little as 10. With a
passive (diode) bias regulator, the current that you need to be pushing
down the divider chain will be not much less than the peak collector
current in order to obtain good bias regulation.

Obviously this isn't practical, so successful bipolar linear amplifiers
use active regulators to obtain a stable bias voltage without wasting
lots of supply current. See the Motorola Application Notes for examples
of circuits.

>
>Just because the PA is biased in linearity at zero drive does not mean
>it stays there, especially with high peak to average powers like fast

Absolutely. The bad reputation of bipolar "leenyears" is mostly due to
poor bias regulation... well, maybe that cause comes second after gross
overdrive!

Vince,

I have used the method Gary spoke of by working the pipe in with
water, it works very well, don't force it and get it stuck, take it
easy and you will be able to get it down quite well. The other
suggestions are good as well, especially buying ground rods that are
copper clad. I do not recommend clamps though, use heavy copper braid
and braise it to the rods with a torch. I discussed this with an ex
military explosives expert, and he recommended 8 rods 1 meter apart in
a rectangle, all braised with copper pipe between them, and then 3/4"
copper pipe to the shack. He claimed incredible increases in signal
strenght and reduced noise with this setup. He also claimed with
using the copper clad rod, and braising the connectorsand he has seen
his old installations still blow circuit breakers of generators
connected to two systems (the method he used to test the ground) with
all of the steel rod rusted away and just the clad still in the
ground.

His theory is placing the rods in a rectangle or circle if you have the real estate, emulate a cage antenna in the ground, increasing the bandwidth and efficiency.

Good Luck,

Glenn Sparks KI5GY

2623. Audio TS440 on ssb?

Hi Tony,
you are correct....there IS no TYPE ACCEPTANCE for amateur gear other
than Part 15 for the rcvrs....IF MR Gasta could read along, I point him
and others (Phil, YOU need to read this also) to Page 12-6 of the ARRL
"FCC RULE BOOK" 10th edition 1st printing (copyrighted ARRL 1995)...
And I QUOTE:

"Like other radio services, amateur equipment must meet certain
standards.
Unlike other services, however, most amateur equipment does not have to
be TYPE ACCEPTED. Type acceptance is an equipment authorization granted
by the FCC, based on equipment-measurement data submitted by the
applicant...."

and on pages 12-7 & 8:

"There is one type of amateur equipment that does require type
acceptance. In 1978, the FCC banned the manufacture and marketing of any
external radio-frequency power amplifier or amplifier kit that is capable
of operating on any frequency below 144 Mhz UNLESS the FCC has issed a
grant of type acceptance for that model amplifier."

This is certainly true for coils used on HF, typically of the order of microhenries.

>suspect any "errors" have to do with parasitics (like capacitance)
>that weren't properly accounted for.

What Tom says is true - the formula should scale exactly to any size, but only if ALL aspects of the coil are scaled: winding diameter, length and wire diameter. It's the last of these which can be mechanically difficult to scale, and often isn't.

One parameter which may change due to incorrect scaling is the Q - but not always for the worse. W7XC published an article in QST which showed that thicker wire doesn't always give a lower Q; for any diameter and length of close-wound coil there is an optimum wire gauge.

The other area where the traditional formula breaks down is in coils of a few tens or hundreds of nanohenries - the kind you might want to use in VHF/UHF lowpass filters, for example. These coils tend to have very few turns - often two or less, in a kind of long spiral - and leads that are a significant fraction of the total length of wire. Such coils behave partly like inductors and partly like transmission lines if mounted above a groundplane (as they usually are). It's very difficult to measure the inductances of these tiny coils, except maybe in a test oscillator, and even then you won't have a pure inductance.

You can model them very easily using Spice, including the free
educational version of PSpice. It doesn't help with the initial design,
of course.

Cable TV coax is 75 ohm, at least here in the USA. It actually can be used to feed dipoles, but I like it for making dipoles and loops-cut it to the usual length for your band, minus about 10% for the lower velocity factor, break the braid in the middle for the connection to the feed line, and short the center conductor to the braid at the ends. For loop antennas, use a single piece cut to length, break the braid at one corner for connecting the feed line, and short the center conductor together at the same spot. It also is very useful for making impedance matching stubbs, I use the formula 246/f in Mhz, x .72 for foam core or .66 for solid core, which will match that coaxial loop to 50 ohm feed line. I use a coaxial loop with the 75 ohm matching stub on 20 meters, SWR less than 1.8 accross the band, and less than 1.5 on 10 meters, and have had great success with it. If you can get it cheap, don't be afraid to pick some up and experiment-just make certain that you have enough to complete your project with a single piece, as it does not tolerate being spliced.

Jeff,

My statements were that modifying amateur radio equipment was and is poor engineering practice. That means that I am against it. The legal issue is not withstanding. If experimentation is the reason; then it is a good way to learn. BUT IT DOES NOT MEAN IT IS ACCEPTABLE FOR THAT SERVICE!

As a "radio tweaker", which Dana has called me... I know better to take a ham rig and substitute it for PROPER EQUIPMENT.

Source record: 96490

No. Both the band-pass tuner and the receiver have both SSB and CW
filters. In the receiver, the CW filter is specified as X455KF300,
and is referred to as a crystal filter. The band-pass adapter doesn't
list filter types, but the called for bandwidths are the same as in
the receiver.

Unless someone is copying the exact circuit, in which case just copy and
not worry about the specs, it is a better choice to get the exact
information from the manufacturer. COnsidering that a lot of circuit
copying has gone on over the years in amateur radio, with each subsequent
person changing something to fit the parts at hand, you never know how
close to the truth the actual circuit is. And both this bandpass
adapter and receiver have extra circuitry for switching between the
filters, which ads to the confusion.

You're just soooo stubborn, William. You're saying it is *always*
poor technical practice to use a modified amateur radio in non-amateur
service. You're just incapable of accepting evidence to the contrary,
instead launching into personal attacks. There are numerous examples
of commercial gear made by Japanese manufacturers that share RF decks
with amateur radios. The *same* RF deck. Technically, then, your
argument has a hole in it.

Legally, a non-type accepted radio may not be used in a service
requiring type acceptance. Period.

None of your insults and patronizing explanations of RF filters
will change the truth.

>As a "radio tweaker", which Dana has called me... I know better to take a
>ham rig and substitute it for PROPER EQUIPMENT.

Well, that's just funny. As an "incompetent engineer", as Wetzel has
called me, I know that commercial gear is often superior to
amateur gear - which is why I've been using Motorolas and GEs in
amateur service for a number of years.

Based on the private email I've received, I believe I can safely ignore
your personal attacks. I've been assured that your attacks have hurt
your credibility rather than mine.

> I am not familiar with the term SKED 80 to describe the pipe. I believe
> that it identifies the wall thickness, but am not sure.
> tnx es 73s,
> WA2RSX

You're right about the wall thickness. Schedule 40 pipe is the most commonly used thickness- anything in your home is probably sch40. Schedule 80 is thicker and used for higher pressure applications like steam and hydraulics. Threads are the same between schedules. You will be lucky if your local plumbing supplier will sell you less than a 10 or 20 foot "stick" of either schedule, but most hardware stores stock sch40 galvanized "nipples" (pieces of pipe, threaded on both ends) in various lengths. Assuming your ground rod is a standard 5/8" diameter, anything from 3/4" to 2" pipe will work. The bigger sizes will give more impact for difficult soils. A 2 to 3' sch40 pipe will make a fine slide hammer, but sch40 caps are cast iron and will break. Use a steel coupling, called a "merchant coupling" in sch40, and a schedule 80 (steel) plug to get the most solid closure on one end of your pipe. The slide hammer alone works best starting the rod. When the top gets down to a comfortable level, use a small sledgehammer on the pipe cap. When the pipe touches ground, hit the rod directly.

Incidentally, the ground in your house wiring should already be a true earth ground, tied to an 8-foot ground rod or other grounding electrode system. The neutral side of your 120v system should also be bonded to this ground at your main service panel. This grounding system should be more than ample for safety considerations. On the other hand, I can imagine that there may be certain benefits to some sort of isolated station ground (for radio equipment only), especially isolation from RF interference and lightning. I would be interested to know what sort of system you work out, and how it works for you.

Hello,

I've made the DTMF decoder described in the ARRL hanbook. It works
perfectly.
I had no problems to find the components here in France. This is the
ideal
solution (although old tech now...) for a remote control...

Cross-posted to: rec.radio.amateur.homebrew,ham.radio.amateur.misc

Hi and thanks in advance for your help.

I was reading a back issue of 73 magazine (May 1996) and came across an article about building the "Bioelctrifier".

I was wondering if anyone has had any experience with this or knows where I can find out more about it

Thanks again.

Please e-mail me direct as I don't get a chance to check in on this newsgroup as often as I'd like.

Tom

Thank you for all of the responses and help with data sheets on all of
the different computer controllable rigs. I will have the YAESU
FT-757 GX interface available on my webpage around the first of
May. (Earlier If I can). The other rigs will be forthcoming.

Thanks again for your responses and support.

I have searched for the best ham radio news stories. These stories are now available for you to read at http//www.sarrio.com. There are articles covering ham products, antenna construction,the Ham Skywaring System, and boating with ham radio, just to name a few. You are welcome to come over and brouse the many articles I have on site. 73's Ray

2650. Re: Need 1/4" metal shaft coupler

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-03 00:00:00 UTC
From: cooperjim@aol.com
Message-ID: <19970303022400.VAA03232@ladder02.news.aol.com>
Source record: 96407

Hi Peter

Have you considered making your own couplers?
I have made a number of shaft couplers by taking a length of scrap hex aluminum bar, cutting a reasonable length, drilling down the length and adding tapped holes at each end. The hex bar is easier to drill the taps in than would be a round bar.
It can also be used to couple two shafts of different sizes by drilling the smaller the full lenght, then drilling the larger half the length using the smaller hole as a pilot.
I used only a hand drill. If you drill a hole the length of the piece, the shafts will align to the hole and if there is any run-out, it will not affect the alignment. There will be some 'wobble' in the coupler but it still works fine.
I assume that you are trying to get the SX-28 working and not necessarily in restored condition. I used one and found it to be one of the more pleasant rigs to use, perhaps because it was the first 'good' receiver I managed to get my hands on. hi.

Good Luck

Dear Friend,
Five minutes and five dollars can change your life!!!THIS IS THE FAIREST, MOST HONEST WAY I KNOW TO SHARE THE WEALTH! Would you like to make thousands of dollars, quickly, legally, with NOCATCH? Then keep reading..... please take five minutes to read thisarticle; it will change your life, just like it did mine. It's true! You can make up to, or over, $50,000.00 in 4 - 6 weeks; maybe sooner! I SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested, keep reading; if you're not, I apologize forwasting your time.

Here we go. A little while back, I was browsing through these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars in weeks, with only an initial investment of $5.00!! So, I thought, "Yeah, right, must be a scam", but, I was curious, like most of us are, and kept reading. Anyway, it said that you send $1.00 to each of the five names and addresses stated in the article. You then place your own name and address in the article at the bottom of the list at #5, and post the article in at least 200 newsgroups, (there are thousands). No catch, that was it! So after thinking it over, talking to a few people first, I tried it.I figured what have I got to lose except for 5 stamps, and $5.00, right? Well, guess what....within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But then money kept coming in , tripling in size and multipying by 10 - 20 times the amount that I got the first week! In my first week I made about 20 - 30 dollars. But, by the end of the second week, I had made a total of over $1000.00!!!! In the third week, I had over $10,000.00, and its still growing. This is my fourth week, and I've made about $42,000.00 TOTAL, and the money is still coming in.....Let me tell you how this works, and most importantly, WHY it works, also, make sure you print a copy of the article NOW, so you get the information off of it, and begin making money.The process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 separate pieces of paper and write the following on each sheet of paper...."PLEASE PUT ME ON YOUR MAILING LIST", and then write your NAME AND ADDRESS. Get five $1.00 bills and place ONE inside each piece of paper that you just wrote on. Fold each paper so the bill will not be seen in the envelope, (otherwise, nosey people who like to steal envelopes with money in it won't get yours). Put one paper inside each envelope, and seal it. Do the same for all five. You should now have 5 envelopes, sealed, EACH with a piece of paper AND a $1.00 bill, stuffed inside of the paper. Make sure those words that were stated above, are written on each paper. What you are

doing is creating a service; this is PERFECTLY LEGAL. Now then, mail the 5 envelopes, with the paper and $1.00 bill in each, to the following 5 addresses:

1. J. Krakowiak , 1112 W. Broadway #1, Anaheim, Ca 928053.

2. J. Sides, Lamar Box 1, South Plains College, 1401 S. College Ave.,Levelland, TX 79336

3. Areg Mkrian, 15 Alma Ave. Belmont, MA 02178-4404

4. A Karns, 4000 NW 53rd, Oklahoma City, OK, 73112

5. C. Newell 480 Capisic Street, Portland, ME 04102

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up, (5 becoming 4, 4 becoming 3, etc.), and put YOURNAME as number 5 on the list. You can slightly alter this article ifyou need to; editing what you need to edit.

STEP 3: Post your amended article, (with your name at #5), to at least 200 newsgroups, (There are close to 19,000 of them). HOW TO DO THIS:If you are using Netscape 3.0, do EXACTLY the following:
1) Click on any newsgroup, like normal, THEN click on 'TO NEWS',which as on the far left when you're in the newsgroup page. This will bring up a box to type a message in.
2) Leave the newsgroup box like it is. CHANGE the subject box to something flashy, like, "NEED CASH $$$ READ HERE $$$" or "FAST CASH"!!
3) Tab once, and you should be ready to type. Now, re-type, (onlyonce), this WHOLE ARTICLE WORD FOR WORD, except to insert your name at#5, and to remove #1 off the list; plus any other small changes youthink you need to make. Keep most of it the same!!
4) When you're done typing the WHOLE article, click on FILE in THISBOX, right above send, not where it says Netscape News On The FirstBox. Click on SAVE AS when you're under FILE. Save your article as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS. Once saved, move on to number 5 below.
5) If you still have all of your text, send, or post, to this news group, now, by just clicking send; which is located below FILE, and right above Cc:.
6) Here's where you're going to post all 200. OK, click on any newsgroup, then click on 'TO NEWS', again, in the top left corner. Leave theNEWSGROUPS BOX alone. Again, put a flashy subject title in the SUBJECT BOX. Hit TAB once you're in the body of the message, and then click on ATTACHMENTS, which is below the SUBJECT BOX. You will get another box to come up. Click on ATTACH FILE, then find YOUR file that you saved; click once on the file, and then click 'OPEN'. Now click on OK. If you did this right, you should be able to see your file name in the attachments box, and it will be shaded green.If you use IE EXPLORER, it's just as easy......HOLDING DOWN THE LEFT BUTTON, HIGHLIGHT THIS ARTICLE. THEN PRINT THIS ARTICLE FOR YOURRECORDS TO HAVE THE NAMES OF THOSE YOU WILL BE SENDING $1.00 TO. NEXT, GO TO THE

NEWSGROUPS AND PRESS "POST AN ARTICLE". A WINDOWWILL OPEN. TYPE YOUR HEADLINE IN THE SUBJECT AREA AND THEN CLICK INTHE LARGE WINDOW BELOW. PRESS "CRTL" AND THEN "V", AND THE ARTICLE WILLBE PLACED IN THE WINDOW. IF YOU WANT TO EDIT THE ARTICLE, DO SO, AND THEN HIGHLIGHT AND COPY IT AGAIN. NOW EVERY TIME YOU POST THE ARTICLE IN A NEWNEWSGROUP, ALL YOU HAVE TO DO IS REPEAT "CRTL" AND "V" AND PRESS POST.
7) That's it. Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 different newsgroups. You see? Now you just have 199 to go!!! (Don't worry, eac hone takesabout 30 seconds; once you get used to it). REMEMBER ..200 IS THE MINIMUM. The more you post, the more money you'll make.AND THAT'S IT!!!! THOSE ARE THE ONLY 3 STEPS THERE ARE!!! You are now in the mail order business, and will start receiving $1.00 envelopes from various people, all over the world, within days.(HINT: THE MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILLMAKE!). You may want to rent a PO Box, eventually, because of all the mail. If you wish to stay anonymous, you can come up with a name, suchas "manager" or"investor". Just make sure all the addresses are CORRECT, please! LET ME TELL YOU WHY THIS SYSTEMS WORKS!! Out of every 200 postings, let's say I ONLY receive 5 replies, (this is actually VERY LOW). So, I made $5.00 with my name at #5. Now then,each person who just sent me $1.00 makes, say, only 200 postings, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. 50 people send you $1.00 now; that's $50.00 you just made! Now then, your new 50 agents post 200 each with YOUR NAME AT NUMBER 3, or10,000 postings, (50 X 200). Average return is 500 at $1.00 each, which is $500.00! They make 200 postings, which is 5000 returns at $1.00 each,which is $5000.00!! And finally, 5000 people make 200 postings each,with YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000.00 BEFOREYOUR NAME DROPS OFF THE LIST!! AND THAT'S IF EVERYONE MAKES ONLY 200 POSTINGS, AND IF ONLY A SMALL % PEOPLE RESPOND!!!When your name is no longer on the list, you just take the latest posting that is appearing in the newsgroups, and SEND OUT ANOTHER $5.00 to THE NAMES ON THE LIST, PUTTING YOUR NAME AT #5 AGAIN, AND START POSTING AGAIN!! The thing to remember is, do you realize that THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND ARE READING THESE ARTICLES EVERY DAY!! JUST LIKE YOU ARE RIGHT NOW!!! So, can you afford $5.00 and see if it really works? I think so.......People have said, "What if the plan is played out and no one sends you the money?" So what! What are the chances of that happening when there are TONS OF NEW, HONEST USERS AND NEW, HONEST PEOPLE joining theInternet and Newsgroups everyday? and, are willing to give it a try? Estimates are at 20,000 to 50,000 new users, each and every day!! Remember, play FAIRLY and HONESTLY and this WILL WORK, I PROMISE YOU!! You just have to behonest. Make sure you print this article out, RIGHT NOW, also, try to keep a list of everyone that sends you money, and always keep an eye on the newsgroups to make sure everyone is playing fairly. REMEMBER: HONESTY IS THE BEST POLICY!! YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY! GOOD LUCK TO ALL, AND PLEASE, PLAY FAIRLY; YOU WILL REAP THE HUGE REWARDS FROM

THIS.....WHICH IS TONS OF CASH!!! ****By the way, if you try to deceive people by posting the messages with your name on the list, and by not sending the money to the people already on the list, you will not get much. Someone I talked to knew someone who did that, and he only made $150.00; and that was after seven or eight weeks!! Then, he sent the 5 $1.00 bills; people addedhim to their lists, and in 4 - 5 weeks, he had over $10,000.00. THIS IS THE FAIREST, AND MOST HONEST, WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT OUR TIME! GOOD LUCK, AND HAVE FUN!!!!

Source record: 96412

This note refers to my article on a logarithmic speech processor in the Winter edition of Communications Quarterly.

In order to use a low impedance dynamic microphone, with a lower level of audio volts than a high impedance dynamic mic, two circuit changes can be made. I tested these changes using a Radio Shack 33-3005 mic and also 33-984 (dual hi/low Z) mic.

In the Microphone amplifier circuit, solder a 1K resistor across R4. This increases the gain of the mic amplifier. Solder a 1.0 uF capacitor across C3. This preserves the frequency response of this stage. Connect a 680 ohm resistor at the mic jack, across the audio line. This terminates the microphone properly.

It is also possible to install a lo-Z to hi-Z miniature transformer instead of the R and C changes. I tested this also. These are available from various sources. Radio Shack has the 274-016 adapter.

From sdonnell@ultranet.nh.comSun Dec 1 18:02:53 1996

The V-Link phones as they are called are a very interesting form of "kiddie talkie". I suspect these could be intended to compete directly with UHF FRS radios. We got one the other day and played with it quite a bit. Yes, 916.875 MHz is their calling/standby freq. They also have 15 other channels on freqs all the way down to 903.48 Mhz that they use on an as needed basis for "private" links and depending on other users/interference on the other CHs. They use good ol analog Wide FM (25 KHz deviation) for voice transmission. CTCSS/DCS is not used for selective(private) calling. Instead, they have a high speed digital ANI code burst that is sent at the beginning of an initaial transmission and anytime the CH remanins inactive for 10 seconds or so. The ANI data burst is apparently how the units instruct others as to what freq to switch to for private conversations.Hardly all too private though...One cute feature they have is digital voice storage, to save messages when the user is not available. I wonder if these might become popualr with certain drug gangs...

The transmit power level from the V-Link is only about .2 milliwatts, so I can't say they the reported "3 blocks" range is not streching it a bit far. Being a licensed Amateur, I have the option of removing the hardwired antenna and replacing it with an SMA receptical to permit attaching it to better antennas and or amplifiers

It is MOST DEFINITELY NOT a Mechanical Filter.
It has CRYSTAL FILTER written on the ID label !!!
This filter is the same one refered to in the handbook.
It is the same physical size as a mechanical filter and appears
pin compatible.
If anyone could advise the date of the original QST article please.
If anyone has a copy of the full QST article, who are the suppliers
refered to for sourcing the filter and are they still in business?
This is a bit like detective work.
Who will fit the final bit in the puzzle?
To remind anyone trying to assist, the original question is:

What are the I/P & O/P impedences for a Collins XTAL filter type no
X455KF300 Part No 526 7073 020
Thank you to everyone who has contributed so far.

There are two main issues: aging and tempco/humidity. The 10811 oscillators we make at the HP Santa Clara Division age about 10^-8 per year. You can improve this 1 or 2 orders of magnitude by measuring the aging against a reference such as Loran C and then feed a slow ramp voltage into the EFC (electronic frequency control) to cancel it out. Tempco is probably not much of an issue in a ham shack where the temperature doesn't vary much. However, you might consider putting your oscillator inside a secondary oven. Also, put a backup battery on your oscillator so that runs continuously, even through power failures. Never power down a crystal oscillator (or turn off the oven) if you can help it. Finally, if your JK oscillator is not hermetically sealed, it may be sensitive to humidity. If so, you can fix that if you want to go to the trouble of hermetically sealing it.

Source record: 96421

The easiest way to allow both stereo and mono plug to be used is to mount a stereo panel socket in the radio. The tip and and ring are then connected to the audio source through ten ohms resistors. If a stereo plug is used the ten ohm resistors are in series with each output. If a mono plus is inserted then one of the resistors will be in series and the other in parallel. Either way some audio will be produced. Cliff Buttschardt K7RR

2665. Cheaper MHW591 for MFJ-259 pre-amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-03 00:00:00 UTC
From: comas@nys01c-303.fir.fbc.com
Message-ID: <COMAS.97Mar3152639@nys01c-303.fir.fbc.com>
Source record: 96422

I have problems with my MFJ-259's frequency counter not being sensitive enough. A recent QST article described using a MHW591 wideband linear amplifier as pre-amp for the MFJ-259 frequency counter. The article mentions using a cheaper, less gain, component but didn't mention a part number. Does any one know of replacement part? The MHW591 covers 1 - 200 Mhz at 35dB for about $50.00 and requires 2 external parts and 13VDC. I was looking for one at about $20.00 with about 15dB gain.

<snip>

I have thought of doing something similar, but using double sided PCB for
low power transmitting on a fixed frequency.

As an alternative I havethought of using two single sided pcb's, one with
the copper material divided electrically into 2 pieces, the second piece
movable over the divided piece forming a split stator capacitor. But early
attempts have not been overwhelmingly successful.

Jeff, your blanket statement "...commercial radios *will* be able to
withstand such temperatures" is not necessarily correct. Certainly, some
will, but come won't. For instance, Yaesu markets their VX-10 radio for
police and fire use and except for the CPU and programming, its identical
to their FT-10,11,50 radios. Continuing, Radio Shack sells 'commercial
radios' that would probably melt in the sun!

>and how it works for you.

If what you have in mind is a separate ground rod that is not bonded back
to the service panel ground, that's an NEC violation and a severe safety
hazard in the presence of a lightning strike.

If you are looking for an RF-ground, Vince, driving a conductor deeper
than a foot or so into the earth is a folly since HF and MF currents travel
on the surface. IMO, a decent 'ground' can be had by burying a standard
ten-foot length of 3/4" copper water pipe horizontally, just below the
surface. For long life, the electrical connection to the buried copper
pipe should be made with 95-Sn/5-Ag silver-solder, which is eutectic at 430
deg. F, and is not as subject to errosion as is ordinary Sn-Pb 'electronic'
solder.

2674. Need Circuit please ... QRP power meter

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-04 00:00:00 UTC
From: mdwatt@usit.net
Message-ID: <3320981b.63046350@news.usit.net>
Source record: 96350

I would like to build a power meter with a combined dummy load for my QRP station. I have 2 200uA meters, and would like to use one to display forward, one reflected (continuous), with no "calibration" needed. The meters are a 0-4+ scale, so calibration would be fixed in three switchable ranges: scale, scale/2 (two watt full scale) and scale*2 (8 watt full scale). The dummy load component would also be switchable in and out, with a pickoff circuit to connect a scope or freq. counter.

I've checked my 1990 Handbook, and QRP classics, with no help. All the circuits there utilize a single meter and some sort of "cal" to measure SWR.

Private e-mail ok, if this topic wouldn't be of interest to the group. I have two articles from Hambrew mag, Spring 96 and Fall 95, both by Bill Hickox of Tejas Kits, K5BDZ, but can't figure out the metering on the SWR/Power meter, nor how to modify the ranges via switch. Nor can I determine the input vs. pickoff circuit on the dummy load.

Glen,

If you are referencing Bill Todd-Brown you might want to give some thought to the geology of the area in which we live. Under Houston and the whole gulf coast area is a continuous layer of water filled sand. This is the layer that Bill Todd was trying to get to and he mentioned that he had more success when he had access to this layer with this multiple ground rod system.

I'd like to here Cecil Moore's comments or Roy Lewellen's comments to the statement by Rich Measures. Something to think about Rich, thanks.....Rick W5RH

2680. Help with Antenna Setup Please!!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-04 00:00:00 UTC
From: kf6htz@hotmail.com
Message-ID: <857538051.23427@dejanews.com>
Source record: 96356

Was wondering about Ideas for an antenna setup for a mobile.
Have Ic-V21AT 2m/220 transciever, also Have RCI 2950(10m mobile)

What kind of "Mono-pole" style antenna could I build that could cover
10 meters (28.1-28.5mhz), 2 meters (144-148mhz), and 1.25 meters
(220-225mhz)?

Planned to be mounted on an 88 Nisson Short-Bed Pickup-truck, with a
Tool box acrossed the bed.

In asking other green-hams(hold the Eggs) I was told an old CB antenna
could be cut short to 10 meters, but the 2 meter and the 1.25 meter would
have to be tuned by a Tuned-style circuit...But we never thought about the
effect of connecting 2 radios to the same antenna! Opps...Any Ideas?

Thanx, Nick

>protection be tied to the house AC ground system.

I disagree. You want them tied together very securely, but only at one common point (usually the service entrance). That way if your antenna system takes a lightning hit, you won't suddenly find your antenna ground six gazillion volts above your house ground. You want both grounds to rise and fall as closely together as you can and that requires they be bonded together as solidly (i.e., low inductance) as possible.

: What sort of luck has any one had ?

From my experience, I must offer the following cautions:

Most glasses are rather lossy at RF; it can be a "snowballing" effect,
because the loss gets worse as the temperature rises (and under power,
the temperature rises, and the loss increases, and the temp rises
further...) If you have any air bubbles between the electrodes and the
glass (or embedded in the glass), be aware that the voltage gradient in
those bubbles may be very high, and plasma may form in them. This is
because of their much lower dielectric constant. Consider how voltages
divide among series c capacitors. Be aware of high voltage gradients at
the edges of your "plates". Ideally, the conductor would curve away in
a smooth arc, not a sharp edge. But also the dielectric would follow
it.

In some work I was involved in a few years ago, we made some capacitors
by depositing metal electrodes on fused quartz microscope slides. These
worked at about 4kV. We used guard rings to avoid high voltage
gradient problems at edges, and the metalization process avoided any
air bubbles.

I have several very good used and tested 4-1000A tubes for
sale at $125 each. Will consider trades of other ham gear, scanners,
computers, etc.

Also chimneys for 4-1000A's at $35 each.

2689. 200+ UHF Rec Needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-04 00:00:00 UTC
From: blum@goodnet.com
Message-ID: <331bb824.2099782@news.goodnet.com>
Source record: 96432

Need 200+ UHF Receivers!

I am looking for a small (Aprox 2" x 2" x .5") UHF receiver.
If my project is successful I will need aproximately 200 of
these units every few months. I can design and build these
units myself if need be, but I do not want to re-invent the
wheel. Here are more specs:

Input sensitivity: -118 db
frequency: xtal controlled, aprox 415.0 Mhz FM
channels: two, within 1Mhz of each other
RF Bandwidth: 12Khz
Audio bandwidth: 100Hz - 3 Khz
Audio Output impedance: 50 - 100 ohms
Audio Power output: 60 - 100 mW
Power Supply: 6V, 40mA, maximum
Temperature range: -22F to +140F
Package: Circuit board assembly only

(Note: the input sensitivity requirement is a little "stiff",
I could add a preamp if necessary)
If you have information that would lead to locating such a device
please forward to blum@goodnet.com Include specifications and
price.

Oh yes, you are absolutely right on the Code requirement that all grounding
electrode systems be bonded together.
The equipment grounding conductors in the branch circuit supplying a
station or individual piece of equipment are intended to prevent exposed
metal from becoming "hot" (with respect to ground) with power from the
branch circuit itself (i.e. 60Hz AC or some DC from an internal power
supply). With ALL exposed metal and ALL grounding systems effectively
bonded together and to ground, there can be no dangerous potentials waiting
for US to provide a path to ground. And by bonding the grounding system to
the neutral side (one place only, at the service panel or meter) we are
more likely, in the event of a fault, to draw enough current to trip the
breaker. This all works fine, and I can think of no reasons to deviate from
this simple, wisely regulated design. Well, except maybe lightning and
R.F.
First, consider a fraction of the tremendous energy of a lightning strike
delivered to some "grounded" piece of equipment. If your station is
supplied by a small branch circuit, there could easily be a hundred feet of
small-gauge wire between you and the ground rod, and who knows how many

wire-nut connections. As the voltage on your computer case soars due to the high-impedance path to ground, your phone line may suddenly become a path for some of the current, which is bad for your modem. This is just an imagined example of the freaky things (i.e. effects that i don't always even begin to understand) that can happen when lightning strikes. If we agree that grounding is good protection, might it follow that better grounding is better protection? If so, perhaps we should drive a ground rod at the station, attach all the most-likely-to-bring-lightning equipment to this, and run a #6 copper wire to the other electrode/s at the service panel. A better ground? I think so. Let's go one step further. A multioutlet branch circuit has an equipment ground that is attached to everything up to the point of connection to your small transmitter. What if we detach the transmitter ground from the branch circuit ground and attach it to the station ground system. We have developed a sort of isolated ground, and everything is still bonded per the Code. (I think hospitals use isolated grounding for patient equipment. Is this a similar system?) Then there's R.F., which does not always like to travel down the equipment ground conductor. Our other equipment can be adversely affected when some of it does. Maybe we should try to confine this high-frequency current to the station grounding electrode system.

Pete and all, please comment.

Hello all.

I am very excited to announce that I have made my nifty little programmer for Microchip Technology's PIC 16C84 microcontroller/CPU available for general release.

The PIC 16C84 is a full blown RISC microprocessor with EEPROM program memory, 13 I/O pins which can run up to 10MHz in DIL 18pin package! If you haven't heard of it before you really don't know what you are missing. Check out http://www.microchip2.com/products/micros/mid/overv/16c84.htm to get the gos' from the horses mouth.

Anyway... I'm not here to advertise for them :)...

My "PICPROG" program is kinda shareware but otherwise fully functional. Figured I should try and get something back for my efforts. :)

The PIC 16C84 MCU is an awesome little device which I have used for several Amateur related projects such as repeater controllers etc. I wasn't satisfied with any of the other programmers I could find so I developed my own.

I've been using it myself for about a year now and have come under preasure locally to make it available to the world. I've just spent another whole day getting a distribution package, on line help and documentation sorted out. It's a bit rough and ready but if you have ever used a PIC 16C84 (or want to) I think you will like it!

If you are interested have a look at http://www.igrin.co.nz/~bryanh/picprog/index.html

Any comments greatly appreciated.

Hi, Peter -

I have had excellent luck with glass-dielectric caps. I had an antenna up for the last year using traps with caps made of aluminum tape stuck onto microscope slides. I used standard slides bought from a scientific supply house, and avoided putting the adhesive side of the tape within the dielectric field. (I used three slides: two with tape on one side of each as "plates", and one between the aluminum for dielectric). I tested them, in the antenna with 100-watts of power running, for 15-minutes key-down on the 20-meter band (the band was dead). Then I took them out and felt them. They were not even warm!

Slides are 1-inch x 3-inch x 1-mm. I trim the foil about 1-mm. away from the edges of the glass to give a longer breakdown path, and have not had any problems from arc-over. But in my use, the "traps" were not resonant, so extremely high voltages were not developed. The high dielectric constant of glass is very convenient. A cap made from almost the full area of one slide gives almost 100-uf. capacitance. It is easy to make a "pack" of as much capacitance as needed for most antenna uses.

Before settling on slides as the most convenient source of dielectrics, I made some caps of "single thickness" window glass (the type used in picture frames - the type actually used in windows is called "double thickness"). I got the idea from an article in one of the early issues of the ARRL Antenna Compendium. They work fine and would provide extremely high breakdown voltage, but the caps become much larger. Since I wanted to build traps as small as possible, the 1-mm. slides are best for my use.

Not true..as there as plastics that can with stand much more heat than any
metal..but they cost plenty.

2696. Re: Ground Rod Installation w/pipe

Source record: 96439

Wow. I did not think my article would trigger such discussion, much of which is still over my head and still prompting me to do further research myself.

My initial thinking was to use a length of solid conductor, obtained after a nurricane caused it to fall to the ground yrs ago from the local utility power pole. My plan is to run this between the ground rod and the chassis of my radio(s) here in the shack, thinking that this would also improve my (desired) RF radiation performance on 40mtrs etc.

I could also run the conductor within the yet unfinished basement approciamately 40 feet to the main water pipe, which is where the electric service panel is grounded.

Would this be as efficient as a single ground rod installation? or would I incur problems with RF resonance, etc. on the HF bands?

Thank you and all the others that have given me much to think further about.

> what might be involved?

Well, yes. With enough added circuitry you could recieve stereo but wow, alot of work just to pick up FM broadcast transmissions.

I don't know of ANY other service that is currently transmitting in stereo. But if you must. I'd take a look at the FM reciever section in the scanner, with the chipsets available today it may be using an FM reciever that already has stereo built in, but I doubt it. There are so many mono FM reciever chips on the market. Your basically looking at building an FM stereo and then just using the synthisizer in the scanner for freq control. What were you wanting to recieve?

...snip...
Fair Radio Sales currently has virtually new Jennings RJ-1As--for $35
each--that are removed from new equipment that was never placed in service.
Although Fair Radio Sales does not check these relays for gas with a high
potential tester, the price is right. If a relay proves to be gassy, Fair
Radio will make it right.
The minimum rated breakdown potential across the open contacts on a
RJ-1A is 3500VDC. A gassy output relay can destroy a good input reed relay
in an amplifier. IMO, it is abundantly risky NOT to test a vacuum
component before placing it in service.

I have tested new, out of the box, Jennings vacuum components that were in
storage for a few years, that had less than half of the rated voltage
withstanding capability. Obviously, pico-scopic seal leaks may go
undetected at the time of manufacture.

At break, the reverse EMF across the RJ-1A's 26v, 0.3H, coil can exceed
450 peak V. Although there are 600V-rated power FETs than handle this much
voltage, a NEEDLESS, recurrent 450v spike across a 24v relay coil is
hardly good engineering practice. A diode and series resistor (or zener)
should be connected across the coil to set the release time as needed (by
adjusting R) and limit the reverse EMF at break.

...snip...

Fair Radio Sales currently has virtually new Jennings RJ-1As--for $35
each--that are removed from new equipment that was never placed in service.
Although Fair Radio Sales does not check these relays for gas with a high
potential tester, the price is right. If a relay proves to be gassy, Fair
Radio will do the fair thing. The minimum rated breakdown potential
across the open contacts on a RJ-1A is 3500VDC.

A gassy RF output relay can destroy an RF input reed-relay
in an amplifier. IMO, it is abundantly risky NOT to test a vacuum
component before placing it in service.

I have tested new, out of the box, vacuum components that were in
storage for a few years, that had less than half of the rated voltage
withstanding capability. Obviously, pico-scopic seal leaks may go
undetected at the time of manufacture.

At break, the reverse EMF spike across the RJ-1A's 26v, 0.3H, coil can exceed
450 peak V. Although there are 600V-rated power FETs that can probably
handle this much voltage, a NEEDLESS, recurrent 450v spike across a 24v
relay coil is

hardly good engineering practice. IMO, a diode and series resistor (or zener) should be connected across the coil to set the release time as needed (by adjusting R), AND put a limit on the reverse EMF spike at break.

> Jack Kovar

The QSK/high-speed switching circuit in the Jan. 1994 *QST* magazine article "The Nearly Perfect Amplifier" will work in the SB-230. You can find an updated schematic on my Web site at http://www.vcnet.com/measures

IMO, the factory-stock SB-230 is not unconditionally VHF-stable.

Since there is much unused space inside the SB-230, adding 160m should be fairly simple. A *QST* magazine article on adding 160m (in-general) appears in the Jan. 1989 issue.

Hi All..
I'm looking for any mods for the IC740.
Anything would be great.

Regards Graeme.....

VK2GDF.

2703. Need information on precision xtal osc.

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-05 00:00:00 UTC
From: Malcolm Mallette <mallettem@trader.com>
Message-ID: <331E341B.5B99@trader.com>
Source record: 96198

I am working on a SETI project here in Indianapolis in conjuction with a Radio Astronomy project using a 5 meter dish.

The observed frequencies will be in the 5.7 GHz ham band or the 10.68 GHz RA band.

We are going high in fequency to avoid RFI from the urban area.

I plan to use the SSB USA downconverter to a ICOM 7100 or 8400 on two meters. The lna will be from Down East. The SSB receiver on the two meter output from the downconverter will output its audio into a FFT program that will search for carriers . We will use FFTDSP or SETIFOX, or, probably, both running in two computers. SETIFOX will step the receiver across the passband of the downconverter output.

Taking into account the bin width of the programs, the integration time, the drift in frequency due to the rotation of the earth (although SETIFOX can now compensate for that) and thr rotation of the ETI planet, the downconverter must have short term stability of a cycle per second, or (better yet) less. Long term stability should be on the order of 250 cycles or 500 cycles per year.

The SSB USA downconverter LO does not have that stability. However, they can construct the LO for the downconverter so that the 117 MHz xtal osc. that is the start of the chain multiplying up to 5.7 GHz (minus 144 MHz) is not present at the LO chain, which will be on the dish with the downconverter, lna and feedhorn.

I need a xtal osc with over at 117 MHz with the stability to give me the desired results. I have heard that some commercial frequency standards lock to the GPS sats time signals, but have no details. I also wonder if the TV color burst osc. from a VCR could be used when locked to a station locked to a network standard.

We do not need a certifiable unit, but need the stability at a reasonable cost. The project will be done with a local University and the lna, downconverter and LO, except the xtal osc, will cost less that $1000. This year we must spend $3000 to $4000 for the dish and the installation cost charged to the science dept by the University Physical Plant. The radio astronomy will be done with a wide band (4 MHz wide) reciever so stability is not a problem. SETI requires stability.

I will appreciate any suggestions.

please send responses to my e-mail address as that is more certain to reach me than a reply on the newsgroup

e-mail is mallettem@trader.com and (work) mallettem@kdac.com

Malcolm WA9BVS

The SSB USA downconverter does not have that stability

2708. Interference from True Fitness Treadmill! Help!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-05 00:00:00 UTC
From: fallowsj@cadvision.com
Message-ID: <5fiuiq$1lse@elmo.cadvision.com>
Source record: 96364
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.boatanchors,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I continue to have severe radio interference to short wave from my neighbour's treadmill (True Fitness Model 450). The interference is in the form of hash pulsing about twice a second (depends on treadmill speed) all the way from BCB through about 20 Mhz. It is a bit like the noise from a TV oscillator (peaking every 15-20 Khz) but pulsating rather than steady. It is between S7 to +10 dB, extremely strong.

The manufacturer sent my neighbor a line filter (which they say cured two previous occurances of this interference) but it did not help. I sent them a fax saying this, but that was two weeks ago, and I have heard nothing back.

I am trying to get the attention of True Fitness, and could use some other cases. If you have experienced this intereference, I would appreciate hearing form you.

Also, if you have solved this problem, I would appreciate your advice even more.

I have a a treadmill made by a different manufacturer and it is absolutely RF-silent, at all speeds, so I know this is not an issue with all treadmills. At this point, however, I do not know if this hash is emitted by all True Fitness Model 450's, or if there is something wrong with my neighbor's unit.

This is dead wrong.
You should read the National Electrical Code. Your home insurance company
has read this code and may hold you to it in the worst case scenario.

Regards,
Pete

[Article crossposted from rec.radio.amateur.antenna]
[Author was Danny Stone NT]
[Posted on 5 Mar 1997 16:26:36 GMT]

I am looking for comments on the RF1 vs MFJ-259.

What I am interested in is the accuracy of the instrument
in the scope of what is intended to do (i.e., the technical
performance).

I am not looking for a feature or price comparioson (that can
be garnered from the ads).

My primary applications include complex impedance measurements,
component measurements, and velocity factor mesurements (for
now!)

My opinion at this point is that the '259 is a more versatile
instrument, but the RF1 is more accurate. Am I wrong?

Tnx !

The problem with your scheme isn't that it might not provide RF ground, but that it doesn't comply with code requirements for grounding. Since such requirements usually aren't important until one needs to recover from a major disaster by getting insurance to cover a loss, it might not seem incredibly important until then. There also is a safety issue involved that most people never think of. You don't want a ground which is unconnected to your other grounds in the house, or things GFI's may not work either. de n8blk/3 -art clemons-

Hi Dave,

Why make it so complicated? The capacitance of an air-dielectric capacitor can be determined easily using one's head or the back of an envelope. (Certainly no computer is needed!). Look in any ARRL Handbook of past few decades. To wit: From the 1961 Radio Amateur's Handbook:

C (Pf) = 0.44*(plate area, sq in)*(nr of plates-1)/plate spacing, in.

For breakdown voltage, same reference as above, use 26,000 volts/inch for reasonably smooth-edged plates.
For 1/8" and 3/16" spacing, respectively, Volts = 3250 and 4875 volts.

73,
Don, W6JL

: > > the modell number is NP-150-DS
: > > The spacing between stators and rotors are 1/8 of an inch

I'd have a very strong suspicion from the part numbers that they are
110pF max and 150pF max, respectively. Personally, I'd measure them
before I'd try to calculate the capacitance, there's so much fringing
in a variable. Also, measuring gives an accurate idea of the min
capacitance, too, which is much harder to calc. from dimensions.
Don's advice on voltage rating sounds pretty good.

You may or may not have had a look at my PIC16C84 programmer I've just released and downloaded the PICPROG10B distribution at http://www.igrin.co.nz/~bryanh/picprog/index.html

If you did PLEASE NOTE. There was an error (a serious one) in the circuit schematic of the orignal release (of a couple of days ago). The error was corected today (March 6, 1997).

The the new shematic is viewable/downloadable on its own at http://www.igrin.co.nz/~bryanh/picprog/picprog.gif.

Of course the 10b distribution ZIP file has been updated as well.

If you have any problem finding or downloading the schematic please email me and I'll send the corrected version to you as an attachment.

Apologies for any inconvenience this might have caused.

Regards
Bryan.

> > >> > a bad thing for packet.
> > >>snip> Lots of good stuff cut.

I was faced with this same problem and solved it in a slightly different way. I connected two transistors in series across twelve volts as though I was making a complementary output pair. Then I connected the relay from the connection between the two emitters and ground. With the two transistor bases connected together, the "output stage" was driven by another transistor. Thus when turned on, the top transistor passes current to the relay. When the pair is switched, the lower transistor passes the current that tries to continue to flow and produce a transistor destroying transient. Worked well for me, YMMV.

Best regards,

Art Borg

A spammer is someone who indiscriminately posts a message to dozens of newsgroups, none of which are on topic for the content of the post. The classic spam is the "Make Money Fast" illegal ponzi schemes we routinely see on all the groups.

The National Electrical Code *requires* that all grounds be
tied together. Failure to do this can void your homeowner's
insurance. It also won't pass the electrical inspector if he
knows his job.

Attempting to maintain separate grounding systems is also a
sure recipe for ground loops which will raise havoc with your
equipment in the event of a strike, due to the very large
Earth currents such a strike generates. That'll express
very large potentials between the two grounds, and anything
connected to both will be toast.

All site grounds must be bonded together. Use a star topology
to provide a station single point. And use a ground window at
your station entrance to enforce equal potentials on all cables
entering or leaving your station area (that includes power and
telco too).

In article <331D554A.6BBC@shani.net> ilani@shani.net writes:
>Can someone tell me what is the upper limit in watts for use in FM
>transmitter without FCC approval.

That depends on a number of factors. In some cases, you can run 1 watt, in others, 100 mW, and in others much less than that. Part 15 of the FCC rules is the place to look for answers to particular questions.

If you go to the FCC website (www.fcc.gov), and go to the Office of Engineering and Technology pages, you'll find a downloadable file which addresses Part 15 operation in relatively plain language.

If you're looking to build a transmitter for the FM broadcast band, the Part 15 rules don't specify a transmitter power level anymore. Instead, there is a specification for a maximum microvolt per meter radiation the device can emit. With a very inefficient antenna, you might be able to run up to 100 mW, but for more typical antennas your output power will be much more limited than that, IE 10 mW or even less.

Basically the rule in this area is crafted to give you an effective range on the order of 100 feet to a typical consumer FM receiver. As receivers have gotten better, the maximum allowable field strength has decreased. Knowing this can be useful because measuring the field strength of these devices can be tricky. So if you build a unit that has a greater range to a typical FM broadcast receiver than 100 feet, you should probably reduce power. (Note this won't guarantee that you are in compliance, but it should get you close enough to avoid trouble with the FCC.)

If you are planning to build the device for some other frequency range, then you'll have to consult Part 15 to determine the exact limits under which you have to operate. In some cases, such as spread spectrum systems at 900 MHz or devices operating under U-NII, you can run up to a watt, and in some cases can expect a range up to 20 miles. This is an area where you have to know what you're doing to remain in compliance.

Note that if you are planning to build these for resale, much more specific requirements have to be met, and you *will* need an FCC Certification.

Note too that the FCC isn't very active in enforcement of these regulations *except* when an incumbent to the spectrum complains that you're causing interference. In those cases Uncle Fed can be motivated to come out and hunt you down. A Part 15 device must

not cause interference to other spectrum users, and *must*
accept any interference it receives from other users of the
spectrum.

>want a ground which is unconnected to your other grounds in the house, or things
>GFI's may not work either. de n8blk/3 -art clemons-

And you don't want to use solder as a connecting method to the made ground (ground rod). Code forbids that. You have to use a mechanical connection (clamp) or CADweld the connection. The reason is that low melting point solder can let go under strike currents (and heating), leaving you without a safety ground connection.

You're not even supposed to clamp *and* solder. That's because you can't confirm the resistance of the clamped joint if solder is present (but which might not be there after melting in a strike, when you need a low resistance ground the most).

Code says that the *maximum* resistance to Earth of a made ground must not exceed 25 ohms. But you'll want to do much better than that. A potential of 200 kV will be expressed across a 25 ohm resistance during a strike. That's uncomfortably high, and can promote side flashes.

You *can* bury a made ground horizontally, or at a slant, according to Code, but there are some factors you need to consider if you do. Maximum coupling to soil occurs in a cylindrical volume defined by the rod length and a diameter roughly equal to half the rod length. So if you bury an 8 foot rod horizontally, you'll want it at least 2 feet deep to provide the effective volume needed for best coupling to soil. (This is only a rule of thumb, and exact soil compositions can cause the volume to vary.)

Soil moisture improves conductivity (dramatically). In dry soils, a shallow burial probably won't be a very effective Earth connection. Going deep, to find the water table, can improve matters. (Of course in some areas the water table is hundreds of feet down, so it is usually impractical in such cases to depend on a deep rod.)

Multiple rods, spaced at least twice their length from each other to avoid charge saturation effects, will almost always offer a superior Earth connection in comparison to a single rod, no matter how deeply it is driven.

An excellent Earth connection method (and one preferred by the Code) is called the Ufer ground. This method offers excllent RF properties because it offers a low impedance to Earth (due to its large capacitance). A Ufer ground is essentially bonded rebar embedded in concrete, with the concrete in intimate contact with the soil. A minimum of 20 lineal feet of half inch rebar embedded in 6 inch concrete is needed to meet Code requirements. Much more is, of course, much better. A 20x20 concrete slab with properly installed interlaced rebar will typically offer a resistance to Earth on the order of 2/3 ohm. That will elevate above Earth potential by only 5 kV during a strike.

That's perfectly satisfactory. Side flashes should be virtually non-existent, and conventional suppression methods, and *proper* use of a ground window, will offer your station complete protection.

>and braise it to the rods with a torch.

The NEC is pretty insistent on a permanent mechanical bond. Clamps
or CADwelding are the preferred methods. Ordinary hand bronze brazing
is acceptable if well done, but soldering is definitely out. Use of
braid is also not a very good idea. Braid has a higher skin resistance
than smooth solid strap, and more inductance too.

Note that a lightning stroke pulse only lasts from 2 to 10 microseconds,
but there can be multiple strokes in a strike, so the total duration
may be considerably greater. There will also be ringing resonances in
any conductors which may take a while to die down. It is essential that
your Earth connection maintain its integrity and low impedance during
the entire event.

>I discussed this with an ex
>military explosives expert, and he recommended 8 rods 1 meter apart in

>
>His theory is placing the rods in a rectangle or circle if you have
>the real estate, emulate a cage antenna in the ground, increasing the
>bandwidth and efficiency.

Use of multiple made rods is effective in lowering the impedance to
Earth for ordinary currents, but close spacing them does virtually
nothing for you in the event of a lightning strike. An effect called
charge saturation occurs during a strike between the soil grains
in the proximity of the rod. This can dramatically raise the dynamic
impedance of the system.

To minimize that effect, you need to space the rods far enough apart to avoid having their charge saturation zones overlap. The conventional rule of thumb is that rods should be spaced no closer together than twice their length, IE 8 foot rods should be spaced no closer together than 16 feet.

Arranging the rods symmetrically around a common point can be useful to allow you to best implement a star connection topology, but you can adapt the rod placement to local obstructions as long as you maintain adequate spacing between the rods.

I'd also note that while copper pipe is better than braid, flat solid copper strap has a number of advantages. Due to skin effect, surge currents will flow on only one surface of the pipe, the outside. There will be no net currents on the inside. But if you use flat strap with a width equal to the circumference of the pipe, the current will flow on both surfaces, effectively doubling the skin area of the material, and halving the skin resistance for the same amount of copper used. This can save you money assuming you pay less than twice as much per pound for solid copper strap as for copper pipe.

And of course you must avoid introducing sharp bends into the conductors. Don't use right angle joints for pipe, or sharply bend strap (except where you're wrapping it around the rod of course). This is to minimize inductance in the current path.

It is important to minimize inductance because surge (and especially strike) current is a pulse, which is, of course, *RF*. Any inductance in the path will cause a potential to be expressed across it by the surge current. You want to minimize that as much as possible.

Model a lightning bolt as a constant current source of about 8,000 amperes. Most of the bolt's energy resides below 2 MHz, but significant fractions extend all the way up to UHF. So inductance is a significant consideration in the downlead path to the Earth connection.

More than any metal? How about tungsten? Offhand I can't think of any
plastics which can sustain 2700 degree temperatures. Now some ceramics
can, and perhaps some carbon fibre composites can for a moment or two,
but plastics?

Of course this is all rather moot since any fire which raises the
radio temperature enough to melt a metal case isn't going to leave
the innards unscathed, not the mention the firefighter carrying it.

The information about RF currents not travelling underground was discovered by the US Army in the 1950s. Somebody thought that a few hundred kilowatts of RF might be able to detonate buried mines. The technique proved to be unsuccessful because RF travels on the surface of any conductor, the earth included.

I conducted numerous tests wherein I connected and disconnected my station ground system during transmitting and during receiving. It made no noticeable difference.

I have measured both, since I was involved in the design of the 259. I would call neither "instruments". Both types vary form unit to unit. Both use hand wired PC boards, and have no special attempts at making the detectors linear. The 259 has less harmonic energy (important for accurate measuments when the load is non-liner with frequency), but the Autek has software compensation of the detector. The 259 does not read scalar impedance, the Autek sort of does.

If you want to accurately measure reactive loads, you MAY need to buy a real RF bridge. What type of accuracy are you looking for?

I am talking ground systems for antenna/tower lightning protection, not AC power grounds. The purpose of such a system is to direct lightning energy directly into the ground, before it gets into your house. Tying this sytem to your house ground gives the lightning energy just such a path into your house. A properly installed ground system will not "float" during such a strike, but should be able to absorb a direct hit. I am talking about a ring of 8 foot ground rods around your structure and bonded together by large bare copper cable. The only items tied to this ring would be your tower and your antenna entry plate, where all your lightning protectors are mounted. Energy coming from either the tower or an antenna line will be passed directly to the ground ring.

Again, I stress, you do NOT want to give lightning hitting your tower or antennas a path into your house, such as the AC power ground would provide.

Ed W7DXZ

I did not see anything on the Polyphaser site mentioned above to contradict this either.

Congratulations on being involved with one of the nicest ham toys on
the market today. It must be very a big winner for MFJ.

Are there any alignment instructions available? The resistance and
SWR readings on mine are okay for now but I'd like to know what to do
if and when they badly disagree with my mismatch standards. Also I
find that both the meter readings start to droop and fall off very
rapidly starting at about 146MHz instead of taking me up well past
the top of 2m. I have the version with firmware for sleep mode
and the `MFJ' switch-on message which I bought new at Dayton '96.

Source record: 96206

G'day everyone,

I'm planning on building a 1/4L-GP antenna for the 2 metre-band. In the ARRL antennabook there are some good instructions on building one of those, but I am left with one more question: what determines the resonant frequency of such an antenna, the length of the radiator or the length of the ground-'wires' ? I need to know, since when I have to fine-tune it (to min. SWR), which wires have to be cut shorter (I want to keep the wires at first a bit longer than necessary, so I can trim them down to the right frequency).

Any help will be greatly appreciated,

Greetings,

Peter Dingemans.

PS: in earlier ARRL antennahandbooks, the lengths of the pieces of wire differ a little bit. Was this an error, or did they do that for a reason? If so, why have they changed the lengths of the wires?

Could be a few things Tony.

The rolloff is most likely due to loss of level, probably due to AGC
being set to high. If you look near the op-amp you'll see three pots
in a row. With connector up, the outer right side pot is AGC, middle
resistance, the one straight up from the middle is SWR, the one on the
far left is freq counter bias.

With the lowest expected impedance termination, adjust the AGC so the
meters do not "drop off" at the highest frequency you expect to use.
Adjust the SWR and resistance for the best average readings with loads
of 25 and 100 ohms (2:1) on 30 MHz.

For critical applications the 259 should be checked on a spectrum
analyzer after adjustment. Harmonics must be -20 dB or greater for
reasonable accuracy into resonant loads.

Some 259's were released with an incorrect change to install a sleep mode. They have a resistor bridged across the back of the board from the op-amp to the frequency counter plug. Add a silicon switching diode (1N914) between the op amp and the resistor, cathode to the op-amp. Without that diode, AGC operation is compromised.

>the 1991 or 1993 _Handbook_.

Thanks for the information ... this article was originally published
in Feb 1990 QST, and I found it in my copy of *QRP Classics* (circa
1990).

I looked at this circuit, and have a couple of questions (I'm not an
electronic guru, I'm a pretty simple kit builder). I'd like to have
two meters, one reflected and one forward, and eliminate the
"sensitivity" adjustment (at least on the panel -- an internal
calibration I expect).

I can see the sensitivity from R6 (variable) to pin 3 on the U2A
LM358. If I wanted to use this two meter concept, would I need to
duplicate everything from the fwd/rev switch forward?

I'm interested in dual metering because I do mostly portable/QRP
work, and the ability to monitor changes in SWR (like if an antenna
problem develops) is pretty important to me, as is the ability to
monitor forward power *always*.

Thanks for the help and advice.

I found W7EL Roy Lewallen's "A Simple and Accurate QRP Directional Wattmeter" to very accurate and stable. The only changes I made was to use HP hot carrier diodes and use a DVM with a look up table instead of a panel meter. I built it using the FAR circuit board in a electrical box with SO-239 bolted on. The FAR circuit board did have a oversized rectangular hole. I did order a new board from FAR without a hole but have not built it up. The switches are soldered right on the PC board and are bolted to a metal electrical box cover. Have not used it in a while, but it I found a brand new $12K Rohde & Schwartz signal generator was drifting with it. I thought it was the wattmeter until I tried an old HP8640!

Ed said:

I am talking ground systems for antenna/tower lightning protection, not
AC power grounds. The purpose of such a system is to direct lightning
energy directly into the ground, before it gets into your house. Tying
this sytem to your house ground gives the lightning energy just such a path
into your house.
A properly installed ground system will not "float" during such a strike,
but should be able to absorb a direct hit. I am talking about a ring of 8
foot ground rods around your structure and bonded together by large bare
copper cable. The only items tied to this ring would be your tower and
your antenna entry plate, where all your lightning protectors are mounted.
Energy coming from either the tower or an antenna line will be passed
directly to the ground ring.

Again, I stress, you do NOT want to give lightning hitting your tower or
antennas a path into your house, such as the AC power ground would provide.

Ed's right, except for one small detail...that whole ring is ALREADY
connected to your house by the coax.
The coax shield is connected to your radio chassis, which is connected to
your house ground. Commercial
repeater sites attempt to keep tower, coax shield, entry bulkhead and
chassis ground at the same
potential during a lightning hit. The accepted way to do this is to bond
all ground rods together, so
that "ground is ground" no matter where you look. AC power ground IS
bonded to the rest of the site
ground system. I'm not sure how much the NEC gets into this, but all the
sites I have visited and
all the site grounding documents I've seen say exactly the same thing.
I'm sure someone with the NEC
on his desk can confirm this. I share a repeater site with a bunch of
commercial users and it is grounded
exactly this way, with powerline ground connected to a huge ground block
that ties it in to all the
tower grounds. Everything called "ground" is tied together. It was
installed by licensed electricians
and inspected by the appropriate authorities, so I know it meets code.

Posted after my two previous posts on this subject:

This post in an admittance of probable error on my part. While I still haven't looked at the NEC code on grounding, I have seen enough information this morning to indicate that "any" ground systems should be bonded together.

I have been mislead by the fact that many of the grounding systems I have been exposed to at my work have not been bonded to the building AC ground system. I don't understand why the "very large" organization I work for doesn't address this, but I intend to look into it.

Radio Shack was selling a chip for about $17, I think you just need to add pushbuttons & audio amp. I built one years ago using a simple flash a/d & d/a converter tied to a 2048 byte static ram. But I don't have a shematic for it. Try the RS store first.

Has anyone heard of a 2m FM mobile amplifier called "The Battery Saver"?

A local newbie (a 17-year-old codeless tech) brought me this amp and asked me to work on it for him. It's designed to be driven by an HT and is supposed to put out about 40 Watts. It's a very strange design and I'm having trouble making sense of it. Normally, amps like this are dirt-simple, but this one's not. There is no manufacturer's name on the amp, just the name "The Battery Saver". There is also no info inside it anywhere.

If anyone can give me any information at all, I'd appreciate it. This kid dropped a bunch of his hard-earned money on this crummy amp, and I really hate to think it's been totally wasted.

I'm looking for the above mentioned electrolytic cap to restore a
Hallicrafters S-53A receiver. Its an aluminum can (twist tab mounting),
1 3/8" dia, 3" tall.

I know quad section caps at 350 V are rare, so I'll settle for the
one with first three sections.

Also, The measured voltage is only about 250 volts, so perhaps a 300
volt cap would work. What do you think? Thanks.

I use a common point grounding system for lightning protection.
While the system was designed for lightning, it also effectively
cured several "RF hot" feedlines coming into the shack. While
it is true a ground rod is a poor RF ground AS FAR as improving
signal radiation efficiency, it is very effective at dissapating RF energy
into the earth in the form of heat energy.

I have thousands of feet of high quality Mil Spec teflon insulated
stranded wire in several colors and sizes. Will sell any length for
$.07 to $.10 per foot depending on size. 18AWG is largest size.
Shipping is $3.00 per order.
Thank you,
Dale

Does anybody know the characteristics of IEEE 802.3 thin ethernet cable?
Is this useful for ham applications?

Here's something unusual about mil-spec teflon coated wire: Most mil-spec wire is silver plated. When silver plated teflon coated wire comes into prolonged contact with transmission fluid, a chemical reaction takes place. The military calls it the "Red Plague". Upon finding this out (I was working on an Army contract connected with the M1A1 tank at the time and this type of wire was prohibited on the contract - we had to use tin plated wire, which is non standard and 3 times the cost), I questioned the wire manufacturers, none of which had ever heard of this. The Army was adamant about this item, but couldn't explain the chemical reaction to me. They seemed to think that a toxic gas may be released when this reaction takes place, which would not be good news inside the close quarters of the tank. Anyhow, we all know how prevalent transmission fluid is around antique radios and phonos, so .....

Tell me about it!
I found some on trash day and put "N" connectors on a 50 ft piece
to test. I came up with .37 db/100ft on 2m (not bad) but
5.7db/100 ft on 432! No wonder the cable guys use so many
amplifiers!

Good coax for short runs or low freqs.

^^^^^^^^^^^^^^^^^^^^^^

I think NO!
If 250V is the DC voltage on the caps the peak voltage is:
250 X square root(2) = 350V
hope this help.

Regarding the use of a common point for all grounds, I've been wondering what this means in the context of the power company's local distribution system. I suspect I probably misunderstand how they handle local distribution, but my impression is that you have:

- Several houses wired in parallel off of a single transformer,

- Each house grounded independently,

- All grounds connected together via long and comparatively "thin" conductors (in the context of lightning protection),

- Perhaps additional grounds at the pole connections for user drop cables.

From the point of view of lightning strikes, isn't this local distribution configuration subject to severe ground loop problems?

With a dipole antenna, I can detect no change in signal strength or a change in noise with or without the ground system connected to my station. When it comes to old wives' tales, radio-grounding claims take the cake. I wonder what kind of ground Paul Bunyan used?

>
> Gary

Amen, Gary. Lightning is closer to RF than it is to DC. When lightning strikes sand, it often melts the sand into tubular glass structures at the *surface* that radiate horizontally like fingers around the strike point. Lightning-glass is NOT formed vertically. So why do people drive 8 foot ground rods vertically into the earth?

I read in *National Geographic* that some lightning strokes have been measured at around 100kA. Hmmmm. If there's a five-ohm ground on a radio tower, and then, according to the National Electrical Code [NEC], a wire from this ground is connected back to the neutral wire on the electric-mains, things could get real interesting at the wall outlets in the house.

To comply with the NEC, a radio receiving antenna must be made of #14 minimum gauge Cu wire. Why 14 gauge?. A half-wave of end-fed #32 gauge wire works quite nicely for receiving AND transmitting 1500w, and nobody except the local hawks and owls are likely to spot it. . Apparently, being a 60Hz expert doesn't automatically make someone a shortwave expert.

Message-ID: <5fpc4f$cds@ncar.ucar.edu>
Source record: 96246
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

FOR SALE:
Crystal filters removed from U.S. military aircraft surveillance receiver model: R 902 A/L. These are six-pole crystal filters with a center frequency of 2.2MHz. They are made by Network Sciences of Phoenix, AZ, pn. 2.2-6. They are a nominal 6kHz wide. Actual specs. given below. These are used filters removed from a number of receivers I have parted out. They have some slight surface corrosion, but will clean up well. All have been checked out to make sure they are still good.

Center Frequency: 2.2MHz
nominal BW: 6kHz
no. of poles: 6
3dB BW: 5.3kHz
6dB BW: 7.2kHz
60dB BW: 13.1kHz
shape factor: 1.82
size: 3" long X 1" high X 1" wide
impedance: 3,250 ohms in parallel with 33pF

price: $35each, postpaid in U.S.

also have available a few modules that will convert from the first I.F. frequency of 2.2MHz down to 455kHz. These are part of the same receiver. Built in well shielded aluminum enclosure, these modules have an FET amplifier stage, a crystal osc. and a double-balanced mixer. Will sell for $15 with one of the above filters.

Im just curious, where might one apply a 6KHz filter? I would think that
BW would be good for AM only. If I were trying to select only one
sideband would this type not be too wide?

The key here is "without FCC approval" I think several have already pointed out it depends on the freq. For example an FM transmitter of 1 watt or less is permitted on 1750m with antenna and coax restrictions as well, without a license. On 144 MHz of course any level of power being radiated would be illegal without a tech class ticket or higher.

I suspect your talking about an FM transmitter operating in the commercial FM broadcast band. Do an engine search for the FCC website, they have most of the doc's available for download.

I'd like to build a Microwave Comb Generator. Now, I see how to drive the SRD, from reading the ARRL Microwave Handbook. But they only address how to generate a specific output frequency, while I want a comb line output.

I guessing, but I think that the output would have to a hipass filter, to remove the funamental. But what about matching? Besides, how does one match multiple octave output, except by a pad?

What's inside the 2 port comb line generators that I see advertised in the trade journals? they look like there can't be much inside!

Dig out your old text on fourier transforms. You'll find that a
repetitive
train of narrow pulses translates to a bunch of frequencies that are
harmonics of the driving frequency. The amplitude envelope is a
Sinx/x shape. You're interested in the main hump centered around zero.
Note that as the pulse width narrows, the first hump gets wider.
Also note that the energy in the narrow pulse is less, so the hump
also gets smaller. So, there's a tradeoff between flatness of the
envelope and the amplitude of each harmonic.

You can use a shorted (and short) transmission line to generate the
short pulse. Make it out of copper plate suspended in air above
a circuit board. Don't try to use the board as dielectric, it's too
lossy.

You're right about having to filter the output. Even tho it looks like
a nice comb of frequencies on the spectrum analyzer, it still looks like
a honkin' big narrow pulse in the time domain. This can zap those
tiny diodes that you're using for mixers.

Pete is correct. I quote from the National Electrical Code Handbook, page 1076, "Antenna masts are required to be grounded to the same grounding electrode used for the electrical system of the building. This is necessary to assure that all exposed dead metal parts are at the same potential. In many cases, masts are (incorrectly) connected to conveniently located vent pipes, metal gutters, and downspouts. This could create potential differences between various metal parts located in or on buildings and lead-in conductors, resulting in possible shock and fire hazards."
Article 810-20 describes in detail antenna grounding. Read it.

Hi Peter OM,

If you make a glass-foil sandwich capacitor, it is easily made
variable, by sliding alternate plates in and out, using a motor
and leadscrew or insulating push/pull line. This has been written up
before, but I cannot recall where. Try window glass; it will work.
Measure the capacity of a single set of plates, and go from there.

Help me on this one if you will. So what if the transmission line is 75 ohms? Dipole is close to 75 ohms. A typical SWR meter is designed to read 50 ohm stuff. 75 divided by 50 is 1.5. If you use 75 ohm coax to feed a 50 ohm dummy load, using a 50 ohm SWR meter, your reading is going to be 1.5 to 1. Whoopee! Am I missing something?

No surprise there... I bet the accuracy of those "Wattmeters" is probably
about plus and minus 35% !!

But that is NOT unique to MFJ. I be that most commercial wattmeters used for
ham measurements are similarly flawed.

Message-ID: <01bc2b3d$903f53c0$218c9bcf@crc3.concentric.net>
Source record: 96307

I am looking for an economical way to construct a receiver to pick up 179.75 - 215.75 mHz. This range is used for wirelss microphones. What I'd like is to have a hand-protable unit with a jack which would allow me to patch it into tape recorders. I guess there are really two options:

1) Find a commercially available unit to cover this spectrum with small enough steps.

or

2) Convert some readily available equipment. Seems to me some sort of FM radio could have its tuner modified to cover this spectrum. Presets would be great, be they hardwired or electronically stored. Scanner would be nice but not a necessity.

I can solder, cut wire and all those sorts of things. I just don't have the knowledge of how tuners work. If anyone can help point in the direction of a solution, I'd greatly appreciate it.

I found that both have some effect. To keep it simple, I'd say
calculate the gp's and leave them as specified, then tune the vertical
radiating element for a match. The angle between the gp's and the
verticle will change the angle of radiation too, play with it some but
you may well find that 150 - 140 degrees is a fair setting.

This is called THE PIEZOELECTRIC EFFECT.
The atomic bonds in the crystal lattice have an acceptable range
of distance within which to "bounce" when stressed mechanically
or electrically. mech <------>elect. forces are interchangeble
with each other as input or output in this effect, hence the laws of
thermodynamics are conserved. It is interesting to note that
mech in-losses=elect out
elec in-losses=mech out

Some of the best amateur radio kits are QRP (low-power) CW transceivers put out by S & S Engineering at somewhere in Maryland. They have a website that you could locate with most any search engine.

Their kits are not for the faint-hearted. The kits use absolutely top-quality parts, boards, and chassis. They are not easy to build because of the compact size but they work very well. I have a 40-meter and an 80-meter CW transceiver that I built from their kits and I use those two QRP rigs more than I do my 100-watt rig.

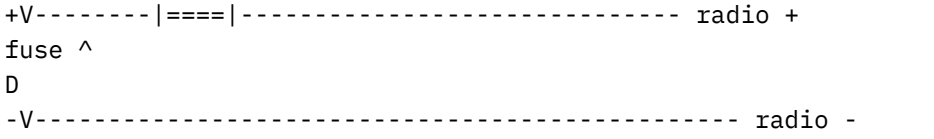
>Thank you for your time de VE9BL Ryan.

Overvoltage is one reason for a crowbare circuit INSIDE the power
supply. Another reason is in case you connect the leads in the wrong
polarity.... in that case a crowbar INSIDE the power supply may not be
much help. Your 20amp power supply would be just cruising along,
happily frying your incorrectly connected radio with 20amps at the
correct 12 or 13.8 voltage! It "sees" no problem.
What me worry?
Solution:
Place the crowbar externally on the radio supply wire leads.
A combination of a fuse/heavy-duty rectifier diode (or 6-15 1A diodes
in parallel) in an "L" curcuit. The diode(s) would of course
be connected across the lines (between the fuse the radio)
and in such a polarity that would not conduct when the radio is
connected correctly.



A fuse CAN be used on BOTH rails to
add further protection. (in case one fuse
doesn't melt fast enough or is defective)

: > can't they :)

: Not really, This is straightforward, if you key a repeater you are
: transmitting in that band and if you are not licensed to transmit in
: that band you are illegal, regardless of the power of the transmitter.
: i.e you may not key a transmitter in the 2 meter band unless you have a
: valid license of at least technician class.

If you bring up a repeater, you are causing interference and are
required to stop. But if you aren't interfering and meet the (very low)
levels of radiated signals in the licence free regs, you can do whatever
you want, (outside of the restricted bands, mostly radio navigation,
safety, and astronomy).

The periodic use (garage door openers, car alarm key fobs, ...)
paragraph (15.231) has a quite broad allocation (anything above 70 Mhz)
with radiated field strength equivalent to a couple of milliwatts of
power (depending of frequency, but with strict time limits per
transmission), and unless they're causing problems, there is nothing you
can do about it.

And in the 902-928 MHz band, you've got an amazing collection of
stuff (cordless phones, wireless speakers, computer LANS) that are
allowed to be there.

: 179.75 - 215.75 mHz. This range is used for wirelss microphones. What I'd
: like is to have a hand-protable unit with a jack which would allow me to
: patch it into tape recorders. I guess there are really two options:

Since those are also US TV channels 7 through 13, try a TV tuner module.

1) there were a couple of articles using TV tuners as spectrum monitors
in Radio-Electronics about 6-10 years ago. One was a analog sweep
unit that used an oscilloscope and another was a IBM PC plug in
board that was computer controlled.

2) Try whatever division of Philips that makes TV tuner modules. They
make them with a direct I2C computer interface that controls the
frequency synthesizer built into the module.

Then you need a circuit that can deal with the 40 something IF output of
the module. Look at some of the FM receiver integrated circuits that
are either made for FM broadcast or commuications FM receivers.
(Wideband or Narrowband). Try Philips Semiconductor divison for both
and Motorola Semi. for commuincations.

If that's too homebrew for you, a couple of the Radio Shack scanner
receivers will pick up in that range. (Pro-26 and Pro-60 according
to the 1997 catalog).

greetings
i just purchased a cordless phone, 800 mhz, and just realised that it
uses a nickel metal hydride battery. I am not complaining. It is
just that how I am going to have to learn about nicket metal hydride
batteries, hi.
So far I am developing an expertice on nicad batteries,
http://home.sprynet.com/sprynet/lar01/nicad.htm
now I am going to have to learn about these new? ones, hi.

Message-ID: <33218706.4896714@news.sprynet.com>
Source record: 96262

recently, I bought a 800 mhz cordless phone.
In the process of selecting it and bying it and using it, so far, I
have been wondering if this phone could be used as a transceiver in
the 900 mhz amateur band.
(1) is/are there service manuals available for that kind of equipment?
(2) i am wondering if anyone has considered building a converter to
move it to 900mhz.
The radios remind me of the amateur's efforts of first getting onto 2
meter fm, converting commercial radios.

What if you keyed a repeater with your transmitter that was legal (below the maximum field strength and you are not licensed)? Things can get harry can't they :)

Cj> From the point of view of lightning strikes, isn't this local
Cj> distribution configuration subject to severe ground loop problems?

Yes, and it seems to me, that is the point of having the ground
and each location at the service entrance, and of that
surge suppressor installed before your meter. That way,
when the ground system brings the surge from the lightning
strike (or it's induction) from your neighbors house,
it gets to ground at your survice entrance without going
through conductors smaller than the conductors bringing it
in the first place. (Ie just the current that can flow in
half inch cable). Since your grounds are tied together,
there isn't a better ground the current wants to get to,
by flowing in through your house to your antenna's super good
RF ground. Because it's already there at the service entrance
bonding.

My question is related. I have noticed I seem to have to
change light bulbs very often in my house. Recently,
I have been operating, while watching the HV meter on the
transciever run from 117 volt lines.
It goes from about 810 to 860 volts different
times of the day. I guess that this represents load imbalance
among my neighbors houses, and that regulation would be
much better accross the 230 volt connection.
It doesn't seem to be connected with any large motors going
on or off in our house.
I haven't begun these measurements, but is this normal,
and is there much one does to correct this?

If the 117 actually goes high enough to burn out the lights
faster than normal, is there minimum specs the power company
can be asked to deliver?

If your line voltage fluctuates as widely as you seem to be saying it does, then you have a real problem, Don! You may want to look at (or have an electrician look at your neutral connection at the box. That's often a major cause of upsurges.

And I'm intrigued to find out how the "...the HV meter on the transciever run from 117 volt lines.
It goes from about 810 to 860 volts different times of the day"! If that's really what's happening (800+V), then you'd better call the power company fast! You may have a bad pole pot (xfmr).

Most power companies will guarantee 115-125V under normal circumstances, with little fluctuation in voltage level. Check with a neighbor, particularly one sharing the same transformer secondary with you if this is appropriate, to see if he is experiencing a similar situation.

With a dipole antenna, I can detect no change in signal strength or a change in noise with or without the ground system connected to my station. When it comes to old wives' tales, radio-grounding stories seem to rank about even with fish stories.

Amen, Gary. Lightning is closer to RF than it is to DC.
Like RF, lightning is subject to skin-effect. When lightning strikes sand, it often melts the sand into tubular glass structures at the *surface* that radiate horizontally like fingers around the strike point. Lightning-glass is NOT formed vertically. So why do most people drive 8 foot ground rods vertically into the earth?

I read in *National Geographic* that some lightning strokes have been measured at around 100kA. Hmmmm. If there's a five-ohm ground on a radio tower, and, to comply with the National Electrical Code [NEC], a wire from this five-ohm ground is connected back to the neutral wire on the electric-mains, a 40 or more kilovolt potential could appear at the wall outlets in
the house during an 8kA to 100kA discharge on the "grounded" radio tower.

To comply with the NEC, a radio receiving antenna must be made of #14 gauge--or larger-- Cu wire. Why 14 gauge?. One or more half-waves of end-fed #32 gauge Cu wire works quite nicely for receiving AND transmitting

1500w, and nobody
except the local hawks and owls are likely to spot it. . Apparently,
being a 60Hz expert doesn't automatically make one a shortwave expert.

Not really, This is straightforward, if you key a repeater you are
transmitting in that band and if you are not licensed to transmit in
that band you are illegal, regardless of the power of the transmitter.
i.e you may not key a transmitter in the 2 meter band unless you have a
valid license of at least technician class.

>
> Tom

With no connection between the radio antenna-ground and the electric-mains,
the energy from a lightning strike on the antenna will dissipate mostly
into the soil around the antenna-ground. However, all grounds have
resistance and reactance, so during a lightning strike, a potential exists
at the antenna-ground connection. Since the typical resistance of a
ground is between 2 and 20 ohms--and lightning strikes consist of many
kiloamperes of current, the I*R potential is typically going to be many
kilovolts.
Does it seem like a good idea to connect a wire from a many
kilovolt/kiloamp source to one's electric-mains, Tom?

2832. Help with Ailing HP8640B

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-08 00:00:00 UTC
From: k1bqt@aol.com
Message-ID: <19970308151801.KAA16086@ladder01.news.aol.com>
Source record: 96325

Hi--

I have a surplus HP8640B with the "military" modulation unit (has 400, 1000, and 5000 Hz tones and more features than the "civilian" version). The problem I'm having is low FM modulator swing. The audio side appears okay (sinewave output 4.5V p-p, meter, meter switch, and over-drive lamp all act as they are supposed to). However, the actual modulator swing is only about 1/3 what is indicated by the meter. Don't know if something is broken or if someone merely screwed up an adjustment. Anyone who has worked on these things have any suggestions or ideas about what is causing this? The RF side is right on.

Thanks--

Rick K1BQT

I run an HF Pactor MBO (BBS) that scans several freqs on each of the Hambands.
At the moment I am using a multiband vertical (Butternut) to accomplish this.
In the near future,I have plans of moving to a place that has trees.
My big plan is to use a loop antenna tuned by one of those SGC-230 antenna couplers advertised as a Smartuner. This device can tune just about anything. I have one and it works very well.
My question is what would be a good choice for the size of the loop?
Sure,one cut to each freq and have a system to select the proper antenna for that band would be the way to go,but I may wind up with only a couple of trees on an acre or two and not a few dozen trees on 10 acres.
I will put up a support for the tuner at around 40 or 50 feet between two trees that are (I hope) a 100 feet tall and a 100 feet apart. From what all I have read though,I should be considering putting up a horizontal loop. Maybe I better be looking for a place with 4 trees on it. Anyhow,I am looking for opinions on size of this loop, whether I put it up
vertically or horizontally.

The search goes on......

Late last year when I was searching for an Ocean Hopper,
many of you forwarded leads to me. I've since located
an Ocean Hopper and my nostalgia project is underway.
Thanks to all!

One of you had a lead that surfaced when you visited another
ham in Zero-land (Kansas or Missouri?) for a radio-swap of
your own. (I believe you had driven a few hundred miles to pick
up a vintage receiver or transmitter.) You thought the other ham
might have an Ocean Hopper and you passed the lead along to me.
Although it turned out to be a Space Spanner, I had a nice chat
with the gentleman on the phone about the radio and restorations.
(The other thing I recall was the gentleman in KS/MO had just
upgraded his call.)

Now, I'd like to pass that lead along to a friend who is looking
for a Space Spanner, but I can not find any of my notes re the
original lead.

If this scenario sounds familiar, or if you know of a Space Spanner
out there in the Midwest someplace, please drop me a note and I'll
pass it along into the right hands.

Thanks again for all the help!

A M Radio poor reception help...Newbie needs help

I live in the S F Bay Area. I want to listen to some radio garden shows coming out of the L A Area.
The reception is very poor. I have heard you can buy some ....brand ..radios that pick up these far and weak signals.

I have also heard you can put a ..magnet....next to a radio to help the weak signals.

I think they sell these at Good Guys? 40 bucks?

Whats a cheap solution to help me hear these weak stations?

Thanks

reply here please

There's no problem buying direct from the factory. Just call them and
place an order. I do it all the time.

I don't think I agree, Rich. First let me state my assumptions:
1. DC grounded antenna (e.g. typical yagi).
2. Coax feedline that remains connected to equipment
at all times.
Because of these conditions, my antenna is already
connected to the power line ground through my equipment
grounds. Therefore, I think it is wise to bring a large conductor
from the tower base to the service ground to shunt off some
of the lightning energy. Feedlines should also be grounded
at the base of the tower.

The remaining energy circulating in ground loops needs to be
choked off with a ground window that *all* conductors entering
the station must go through.

Do you still disagree with this? I believe that Gary Coffman
recommends such a configuration. (Correct me if I'm wrong,
Gary.)

Tom

...snip...
 Improving signal radiation by dissipating RF energy into the earth as
heat energy does not make sense to me. IMO, delivering more RF energy into
the antenna is more likely to improve signal radiation.

If you have RF-hot coax feedlines--like I once had, Peter, it sounds like
you are not using coax choke-baluns at the feedpoints of your antennas. A
coax choke-balun is used wherever an unbalanced-to-balanced transistion
takes place, so that the RF potential on the balanced element does not
appear on the outside of the coax feedline---and subsequently on anything
that is connected to it in the station.. A for instance would be at the
center of a coax-fed dipole antenna. At 7MHz, a satisfactory choke-balun
can be made by winding roughly 10 feet of the coax feedline on 3" ABS
plastic drainpipe. The coil of coax can be fastened to holes in the ABS
with black (UV-resistant) nylon cable-ties. The coil of coax on such
baluns should NOT be placed against metal surfaces.
3' ABS pipe also makes a suitable center insulator for dipoles. Thus, a
choke-balun can do double-duty as the center insulator.

Hmmmm... then what would you say about 2m <-> 10m FM links?
You know, a 2m box coupled to a 10m box. A Tech can then cause
the 10m box to transmit without being licensed to transmit
in that band.

I believe the answer is not so straightforward, at least not
as you put it. I suspect the answer is that the operator of
a Part 15 legal device would not be liable for kerchunking the
ham repeater, though this might be considered interference.

A few questions...

What time of day is the program broadcast?
What is the frequency of the broadcast station?

Answers to these questions will help to determine what is the best
solution to your problem (short of moving to the LA basin...)

>
>Allen Wallace
If you look at Hewlett Packard microwave semiconductor handbooks
you should find some coaxial modular comb line generators. You
drive them at 100, 500 or 1000 MHz and they generate a spectrum up
to at most 18GHz, but the output power levels are very low.
I think there are some HP application notes on the use of Step
Recovery Diodes that are informative on matching networks.
There are some fairly simple L-C matching circuits in the coaxial modules, I
believe. Whatever output circuit you use will have to be wide band. A high
pass filter fits the bill. I have used quarter wave tightly coupled lines,
but for 9-13GHz bandwidth only (some time ago). You would need a more
broadband structure. On the input side, you need to arrange the input
matching so as to reflect the harmonics. You want those to exit via the
output port. Something with a series inductive element would do. However,
the series inductance might have a higher order resonance at high harmonics
that would affect the response. The best way to get a flat response is to use
resistive matching, or a controlled mismatch, which implies loss and low
efficiency. If you have the budget you can use broadband amplifiers to make
up the loss. You certainly need to suppress the fundamental, and low order
harmonics (if not wanted) since these
will be much higher amplitude than the higher order harmonics. So in fact
your filter response will need to be tailored to the amplitude spectrum of
the SRD output in order to get a flat series of harmonics. If you have a
system that selects a single harmonic, such as is done in some spectrum
analysers and frequency synthesizers, you don't necessarily have to have a
flat output spectrum. If you are building the microwave equivalent of
a BC221, you don't need a flat output spectrum either as long as the
spectral lines are all within a usable range of signal amplitudes.
On the 9-13GHz comb generator I built, I had a series matching transmission
line to match the input power (at about 1GHz) into an SRD, and a quarter wave
coupled output line centred on about 11GHz, followed by a filter that

suppressed mainly the fundamental and first few harmonics. More of a band stop filter. I think I have seen waveguide comb generators, where the input is matched to a low-impedance SRD by stepwise impdance reduction of the waveguide (this can be done in a broadband manner, using multiple line sections). Waveguide isn't multi-octave unless you use ridge guide carefully so you will probably need to use a coaxial or microstripline circuit.
A design based on a low pass filter matching to the diode impedance followed by a high pass filter to the output should work. Obviously the element values will depend strongly on the type of diode, frequencies, and what power level you wish to drive at. A technique used in cellular radio nowadays is to use a closely coupled SRD and mixer diode (these can be obtained as a module) to which you couple power, and the harmonics are coupled internally so you don't get involved in output circuit design, and it functions as a harmonic mixer. From your posting, I don't know if this would be useful for your application since you haven't told us what you are ultimately trying to do.

If someone was doing a simple homebrew receiver, the filter and converter board might be a starting point. Collins often used IF's in the 2 MHz region for the first IF to minimize image problems, in the days before up conversion designs were used. The 6-kHz filter could serve as a "roofing filter;" with the sharper filtering done at the final 455 kHz IF. I guess folks don't homebrew much anymore.

>ground is between 2 and 20 ohms--

Yeah Tom. Listen to Rich. He would rather have the lightning find
a return path through the house wiring, and hopefully through your
ham equipment. The concept of a common point ground isn't so much
as providing a sink for lightning, but rather a common point at which
all possible lightning paths share a common path to ground, whether
ther strike take place on your power, antenna, phone line or CATV
cables. This common point should near the service entrance, and
through a ground rod as specified national and your local electrical
codes. This ground rod should be used as common ground point for
all coax cables entering the home as well.

The actual ground resistance becomes less important, so long as
the ground rod is the ONLY return path provided!

We just had two house fires in Enfield CT due to falling power lines
hitting CATV cable drops. The cable company -- in their infinite
wisdom -- grounds CATV drops AFTER the cables enter the home.
In my home, they grabbed a nearby water pipe, assuming that it
was attached to the electrical ground. In the cases of the two homes
in Enfield, a similar situation existed. The CATV cables became
overheated and burst into flames, inside and outside of the building
structures. Had the CATV cables been properly grounded at the service
entrance, no interior damage would have occurred.

no. The shield connects to an elevated counterpoise. The shield is not
connected to the antenna lightning-ground. However, the center conductor
is connected to the antenna, so the coax could still be a source of grief.

>The other end of the coax shield

true.

> You have
> bonding of both ground systems whether you want it or not via the coax.

Not necessarily. Over 99% of the time, the coax is disconnected. I do
not connect the coax to my radio equipment during lightning storms.

An electronic parts bonanza (or use them as phones).
Only nine bucks or less, plus shipping!

Computerized, digital, multi-line phones to use as-is, or
strip for parts! They're Eagle Telephones,
each with the following, plus more.

o Epoxy encapsulated magnetic reed-switch (phone handset proximity
sensor)

o 12-button high-quality feel phone pad, about 2"x 3", with 8-wire
flat ribbon cable/connectors.

o 2" diameter, 8-ohm speaker

o Bunch of ICs: CD4081, HCF4069, 2x HCF4066, LS404CB, 2x ULN2003A,
2x ULN2032, SN75176, AMI 8948 (programmed 8048?), LM386

o 3.579575 MHz crystal

o 1.5" x 7" 20 push-button selector panel. Each button has two
colored LEDs and room to insert a small paper label. 34-wire
ribbon cable/connectors.

o 4-digit LED display, with ":" and decimals built onto the display

o Astec daughter card, 2.5"x 1.5", that appears to be a TelCo
interface

o One 4-pin, and two 6-pin J-connectors (telephone connectors,
often used on computer network cables, too).

o 8 position DIP switch

o Two 10k-ohm dial pots

o Beige enclosure. I have only a few handsets/cords. Let me
know if you particularly are interestd in the handset.

I'll sell these for $9 + shipping, prepaid. Check exact shipping
costs with the UPS web site cost calculator (my ZIP is 80840):
http://www.ups.com/using/services/rave/rate.html.

E-mail (mork@usa.net) or call Brian, 719-472-0707.

2860. FTV = WEFAX-FAX-SSTV-RTTY with SoundBlaster

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-09 00:00:00 UTC
From: "Brian E. Cauchi" <gcauchi@keyworld.net>
Message-ID: <01bc2cd3$3ce08540$0101a8c0@gcauchi.keyworld.net>
Source record: 96154
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc, rec.radio.amateur.space

Hello... Brian here!

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to:

RECEIVE - WEFAX, FAX, SSTV, COLOUR SSTV and RTTY
TRANSMIT - FAX, SSTV and COLOUR SSTV

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside this software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
RTTY (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

Registration promotes the further development of this software and entitles the user to future upgrades paying only for delivery expenses, if any.
Current release is 0.98f

Finally, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

Help Please with understanding inductor...

I was at my local cheap parts supplier to get or make
a power line RFI filter, to keep noise out of my transciever
power supply/linear amp power supply. (I don't want anything
sending noise up to antennas to radiate the noise into my antenna.)

I found some inductors. 27 turns close wound in 3 layers of
#12 wire on a 1/2" gray rod core. The inductance meter
seemed intermittent and unreliable, but measured 26 micro Henrys.

I was going to use these in series with the power line
with some capacitors across the line.

Then I found some nicely sealed line filters I am using instead.
Now I have some questions about what these coils may best be used for.
Questions:
1. Since these cores are rods and not toroids, they are not
self shielding. Therefore, would they tend to radiate any
noise in the line?
2. Since they are close wound, would they have enough stray
capacity to couple rf noise past the inductors anyway?

3. Might they better be used in a low voltage power supply
as filter chokes. They don't have enough inductance for
a critical inductance, but maybe they could reduce the
start up surge current, and repetitive recharge current
to a bank of 2 67,000 mfd filter caps for a 25 amp 13.8 volt supply.
The transformer windings were used full wave for a 5 volt 20 amp
linear supply for a Naked Mini. But the transformer winding
is about #8 wire, and the 9 2N3055 pass transistors seem to be
able to handle a bit more current. But I will have a bit extra
voltage after making a full wave bridge for about 29 volts
=no load voltage. But again, would I have these large
spikes to recharge the caps every cycle, so the rod would
be an antenna sending 120 cycle hum everywhere. Are toroids
much better inductors because they are self shielding?

I don't know what type of core material this is, except
it is grey. All cores I have seem to be grey.

Thanks for any help.
Don

Assuming your power supply is relatively straighforward, a 50 volt
fluctuation in the 800 volt range is roughly proportional to a 7 or 8 volt
fluctuation in the 115 volt range. That's probably within specs.

>gain/less overload required.

If you are talking about a frequency counter pre-amplifier, then
MMIC's like this will work.

If you are thinking of more output for SWR measurements, the MMIC
style devices are useless. The MFJ-259 already puts out more power
than they are capable of providing.

Not only that, the MMIC's have too much distortion. That will
compromise accuracy. Not a problem with a frequency counter, but it is
with the SWR system.

>Similar parts also sell as HP MSA-0x04, -0x05 and -0x86, formerly sold
>under Avantek name.

Ditto here.

MMIC's are terrible devices when you need high power, low distortion,
and minimum current demand.

You can do much better at less current with CATV type transistors. The
exception is things like frequency counters, where harmonic
distortion isn't as important.

> a return path through the house wiring, ...snip...

Assuming that the antenna-ground is some distance from the electrical-mains
service-entrance Neutral ground, the many kilovolt I*R pulse that appears
across the antenna-ground during a strike would NOT 'find
a return path through the house wiring'--- UNLESS a wire from the
antenna-ground were connected to the mains Neutal wire, Peter.

From measurements I conducted on the soil hereabouts, the resistance of
the NEC-ground on my service entrance is roughly 25 ohms during the rainy
season. 25-ohms hardly looks comforting when we are talking about
discharging 8 or more kiloamperes.
The antenna-ground on my 3/8 wave 80m vertical antenna is about 100 feet
away from the NEC- 'ground' on the Neutral wire at my service-entrance.
Connecting a wire between these two grounds would seeming be
electrical-lunacy. .

> Gary.)
>
...snip...

I agree with Gary that feedlines need some sort of shunt to ground before they enter the house. However, is it possible to effectively ground a feedline at the base of a tower? Since there is no such animal as a zero-ohm ground, and we are talking about many kiloamperes, baring Gary's extraordinary measures, the safest shunt to ground seems to be don't leave home without tossing feedlines out the window onto the ground. For coaxial feedlines, this practice is made considerably easier by using quick-disconnect Type-C connectors at the windows. For open-wire feedlines, banana plugs speed things up.

Neverthe less, I still see a problem with connecting a path from my tower-ground, which is elevated to many kV during a strike, back to the Neutral connection on my electric-mains.

Message-ID: <3322E271.596C@aade.com>
Source record: 96276

If you downloaded AADE FILTER DESIGN from my web site and have
installed it please read this.

The removal instructions list some files installed in the
WINDOWS and WINDOWS/SYSTEM directories

DO NOT DELETE ANY OF THESE FILES when removing aade filter design.

Most of them were not installed by aade filter design but are part
of WINDOWS 95 and probably WINDOWS 3.1
Deleting them could cripple WINDOWS.

To remove AADE FILTER DESIGN simply delete the directory where
you installed it and the subdirectories contained.

ie: C:\filter

Microsoft does not provide information about what files need to be
distributed with an application, instead Visual Basic creates
distribution
disks without explaination.
Microsoft makes good software but their documentation stinks
and their technical support is virtually none existant. You have a
better chance of directly communicating with GOD than
Microsoft technical support.

Hope no one had any problems with this (other than the one person
who brought it to my attention).

Neil

There are a number of shareware programs to do that. One of them that comes to mind is the filter design program for Windows called "Tunekit" by Max Froding, which includes a coil design feature. Check out http://users.aol.com/maxfro/private/tunekit2.html

So we do agree. Of course, if you can completely isolate
the antenna system from the house, it is best to leave it
isolated. ("Throw the feedlines out the window". This
presumes that you *always* will do it.).

If you can't do that, then Gary's ground window approach
is best.

I don't see any disagreement anymore.

Tom

If sand were a good insulator, why does lightning-glass exist? In
nature, sand is composed of far more than pure silicon-dioxide. It
contains impurities---which is why common sand is a semi-conductor.
However, this is a moot point. My point is that lightning-glass does not
form much below the surface. It seems to me that you reject the theory of
RF skin-effect, Peter. Good luck.

If RF current can exist 8-feet below the surface of the earth as Peter
contends, why (in the 1950s) did U.S. Army researchers conclude that
detonating underground explosive-mines (that were buried only a few inches)
with hundreds of kilowatts of RF was impossible?

BTW, some decades after the Army's mine research, the Brits discovered
that an entire minefield could be set off en masse by detetonanting a cloud
of (ground-hugging) propane gas from topside with a certain pattern of
parachute-flares. This device came to be called the Concussion Bomb, and
later, the Fuel Bomb. The pressure that this device puts on the ground is
such that even tank and truck mines happily explode---which of course has
nothing to do with radio-ground.

2880. Of T368 interest only

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-09 00:00:00 UTC
From: trouts1@aol.com
Message-ID: <19970309180600.NAA28124@ladder01.news.aol.com>
Source record: 96281

68 owners,
I have found that some T368 owners have common problems that would seem to be in all rigs. As it turns out other owners do not have the same
problems. A few examples are problems with the vaccum relay for T/R switching on E and F models. Another is a sharp point near the final tank coil which causes arcing which is cured with filing.
I have receintly found out that there were several (if not more) manufactures
of the T3. The problems may be due to design or specification latitude where
manufactures introduces differences or the design may have changed slightly
from order to order. I decided to track some T368's with their order numbers
to see if anything common shows up as common. So I am requesting T3 owners to send me their TYPE, SR #, ORDER # and MANUF. to see what the contract span was and how SR #'s were issued. If you have time please
include what you may have problems with or any other information you may know.
So far I have only been able to locate informaiton about the T3 A,B and C
models. Fair included one E schematic in the A,B and C package they sell.
I would like to purchase manuals for the other models if anyone has them.
I have been told that the Gov't has not released the manuals past the C model.
It may be that there was not manual for the E and F. Thay may have been covered by addendiums or bullitans? If anyone has any information please let me know.
Please send any infomation you have to me at:
trouts1@aol.com and CC
davidk@artax.webo.dg.com
If there is enough enformation to be interesting I will see if ER is interested in
posting it. I will keep a list of people who respond and will send you the
compilation as it develops.
Tkanks

2881. $$NEED CASH$$ READ HERE!!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-09 00:00:00 UTC
From: BMC Physics Student <student@physics.bmc.edu>
Message-ID: <3322FFF7.1E5F@physics.bmc.edu>
Source record: 96282

NEED CASH?!! READ THIS!! IT WORKED FOR ME IT WILL WORK FOR YOU!!!

When I read this I thought why not? I have tried many money saving techniques or money making services and I thought that even if this didn't work I am only out five dollars.

But this really works. I made 55,000 dollars in cash and I not only paid off my debts but I had a good bit left over for a cruise for me and the wife. Just follow the steps below EXACTLY and you to can be making between 7,000 and 60,000 dollars in a few weeks.

FOLLOW THESE STEPS EXACTLY:

Step 1.

Immediately send $1 US cash (a dollar bill, no checks, no money orders) to each of the 5 people on the list below. Wrap this dollar in a note with
the words: "Please put me on your mailing list." (In this way, you're not
just sending a dollar to someone, you're paying for a legitimate service.
Also, to discourage those who prey on cash in the mail, be sure the bill is
completely hidden by the note.)

1#- Christy Moyer
415 May Street
Platteville, WI 53818

#2 Steve Dorr
152 South Street
Bridgewater, MA 02324

#3 Bobby Binion
P.O. Box 2435
Havelock, NC

#4 Jounan Lee
210 Rogers Rd. Q305
Athens, GA 30605
USA

#5 Anika Torruella
Box C-992
101 N. Merion Ave
Bryn Mawr, PA 19010

Step 2.

Now, remove the top name from the list, and move the other names up. This way, #5 becomes #4 and so on. Put your name in as the fifth one on the list.

Step 3.

Post the article to at least 250 newsgroups. There are at least 19,000 newsgroups at any given moment in time. Try posting to as many newsgroups as possible. Remember the more groups you post to, the more people will see your article and send you cash!

HOW TO DO THIS:

If you are using netscape 3.0, do exactly the following:
1)Click on any news group like normal, THEN click on "TO NEWS", which is on the far left when you're in the newsgroup page. This will bring up a box to type a message in.

2) Leave the newsgroup box like it is. CHANGE the subject box to something flashy, like, "NEED CASH $$$ READ HERE $$$" or "FAST CASH".

3) Tab once, and you should be ready to type. Now re-type, (only once, this WHOLE ARTICLE WORD FOR WORD, except to insert your name at #5, and to remove #1 off the list; plus any other small changes you think you need to make. Keep most of it the same!!

4) When you're done typing the WHOLE article, click on File in THIS BOX, right above send, not where it say Netscape News On The First Box. Click on SAVE AS when you're under FILE. Save your article as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS.

Once saved, move on to number 5 below.

5) If you have all your text, send, or post, to this newsgroup, now, by just clicking send; which is located below FILE, and right above Cc:.

6) Here's where you're going to post all 250. OK click on any newsgroup, the click on "TO NEWS", again, in the top left corner. Leave the NEWSGROUP BOX alone. Again, put a flashy subject title in the SUBJECT BOX. Hit TAB once you're in the body of the message, and then click on ATTACHMENTS, which is below the SUBJECT BOX. You will get another box to come up. Click on ATTACH FILE, then find your file that you saved; click once on the file, and then click "OPEN". Now click OK. If you did this right, you should be able to see your file name in the attachment's box, and it will be shaded green.

If you use IF EXPLORER, it's just as easy...HOLDING DOWN THE LEFT BUTTON, HIGHLIGHT THIS ARTICLE. THEN PRINT THIS ARTICLE FOR YOUR RECORDS TO HAVE THE NAMES OF THOSE YOU WILL BE SENDING $1.00 TO. NEXT, GO TO THE NEWSGROUPS AND PRESS "POST AN ARTICLE". A WINDOW WILL OPEN. TYPE YOUR HEADLINE IN THE SUBJECT AREA AND THEN CLICK IN THE LARGE WINDOW

BELOW. PRESS &#65533;CRTL&#65533; AND THEN &#65533;V&#65533;, AND THE ARTICLE WILL BE PLACED IN THE WINDOW. IF YOU WANT TO EDIT THE ARTICLE , DO SO, AND THEN HIGHLIGHT AND COPY IT AGAIN. NOW EVERY TIME YOU POST THE ARTICLE IN A NEWSGROUP, ALL YOU HAVE TO DO IS REPEAT &#65533;CRTL&#65533; AND &#65533;V&#65533; AND PRESS POST.

7) That&#65533;s it. each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 different newsgroups. You see? Now you just have 199 to g0!! (Don&#65533;t worry, each one takes about 30 seconds; once you get used to it). remember...200 IS THE MINIMUM. THE MORE YOU POST, THE MORE MONEY YOU&#65533;LL MAKE.

AND THAT&#65533;S IT!!!! THOSE ARE THE ONLY 3 STEPS THERE ARE!!!!

You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the internet is new and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses. Yes, that&#65533;s right, only 5. You make $5.00 in cash, not checks, but real cash with your name at #5.

Each additional person who sent you a dollar now also makes 250 additional postings with your name at #$, 10000 postings. On average then 50 people will send you $1.00 with your name at #4,... $50.00 in your pocket!!

Now these 50 new people will make 250 postings each with your name at #3 or 10,000 postings. Average return, 500 people,...$500.00. They make 250 postings each with your name at #2 =100,000 postings = 5000 returns at $1.00 =5000.00 in cash!

Finally 5,000 people make 250 posting each with your name at #1 and you get a return of 55,000 before your name drops off the list. And that&#65533;s only if everyone down the line makes only 250 posting each! Your total income for this cycle is $60,000.

From time to time when you see your name no longer on the list, you take the latest posting you can find and start all over again. The end result depends on you. You most follow through and post this article everywhere you can think of. The more postings you make, the more DOLLARS end up in you mail box. It&#65533;s too easy and too cheap to pass up!!! So that&#65533;s it. Pretty simple sounding stuff, huh? But believe me, it works.

There are millions of people surfing everyday, all day all over the world. And 100,000 new people get on the net everyday. You&#65533;ve seen the stories in the paper. So, my friend, read and follow the simple instructions and play fair. That&#65533;s the key, and that&#65533;s all there is to it. Print this out right now so you can refer to this article easily. Try to keep an eye on all the posting you made to make sure everyone is playing fairly. You know where your name should be. If you&#65533;re really

not sure or still think this can't be for real, THEN DON'T DO IT. BUT
PLEASE PRINT THIS ARTICLE AND PASS IT ALONG TO SOMEONE YOU KNOW WHO REALLY NEEDS THE BUCKS, AND SEE WHAT HAPPENS.

REMEMBER...HONESTY IS THE BEST POLICY. YOU DON'T NEED TO CHEAT. THE BASIC IDEA IS TO MAKE BUCKS.

GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL WIN AND MAKE SOME REAL INSTANT MONEY!

***By the way, if you try to deceive people by posting the message with your name on the list and not sending the bucks to the people already included, you will not get much. I know someone who did this and only received about $150.00 (and that's after 2 months). Then he sent the 5 bills, and people started adding him to there lists, and in 4-5 weeks he had over 10,000!

People have asked me if this is really legal. It is! You are using the Internet to advertise your business. What is that business? You are assembling a mailing list of people who are interested in home based computer and online businesses and methods of generating income at home. Remember - people send you a small fee to be added to your list. It is legal. What will you do with your list of thousands of names? That's up to
you, but this is how it becomes legal. To be legal, you must acctually sell
a product or service if you expect to receive a dollar. Anyone sending a dollar back to you must receive something in return. You have already received this letter due to the participation of each of the 5 persons listed below. This letter and the plan given within this letter are a "product" that you have received. Thus, you will be sending $1.00 to each
of the 5 persons given below in exchange for receiving this letter and for
asking them to provide the "service" of adding you to their mailing list.
THIS IS A SERVICE AND IS A 100% LEGAL BUSINESS OPPORTUNITY WHICH IS COVERED IN TITLE 18, SECTION 1302 AND 1342 OF THE POSTAL AND LOTTERY LAWS.

Include your address. You do not need to include your name. This is the key to
the program! Also, let each person know what number they are in your letter
so he/she knows which cycle he is receiving the $1.00 from. Make sure that
you
retain EVERY name and address sent to you, either on computer or hard copy,
but do not discard the names and notes that people send to you. This is PROOF that you are truly providing a service, and should the IRS or some

other government agency question you, you can provide them with this proof!
Therefore, you will start a list of all the people who send you a dollar requesting to be added to a mailing list. Actually, you will want to safeguard this list because it can generate even better responses and much more money later!

PLEASE GIVE EVERYONE A CHANCE AND BE HONEST, AND THIS WILL REALLY WORK

TRY IT!!!!!!!!!!!

> Connecting a wire between these two grounds would seeming be
> electrical-lunacy. .
> The "wire" between the two grounds in your case, Rich, is the shield of your coax. I lost 150 feet of RG-213 in this manner. The shield of your coax is connected to your antenna-ground, is it not? The other end of the coax shield is connected to the chassis of your radio. The green wire in your a.c. power cord goes from the chassis of your radio to the NEC ground bus in your service entrance panel, which is strapped by a big wire to the neutral bus in the panel. You have bonding of both ground systems whether you want it or not via the coax. The NEC requires that all antenna system, cable TV system, water well pumps, and other electrical devices all be bonded to the service entrance ground. Someone wisely stated in an earlier post that an insurance adjuster can make life very miserable for someone who ignores NEC guidelines.

> a return path through the house wiring, ...snip...

Assuming that the antenna-ground is some distance from the electrical-mains
service-entrance Neutral ground, the many kilovolt I*R pulse that appears
across the antenna-ground during a strike would NOT 'find
a return path through the house wiring'--- UNLESS a wire from the
antenna-ground were connected to the mains Neutral wire, Peter.

From measurements I conducted on the soil hereabouts, the resistance of
the NEC-ground on my service entrance is roughly 25 ohms during the rainy
season. A 25-ohm ground hardly looks comforting when we are talking about
discharging 8 or more kiloamperes.
The antenna-ground on my 3/8 wave 80m vertical antenna is about 100 feet
away from the NEC- 'ground' on the Neutral wire at the mains service-entrance.
Connecting a wire between these two grounds would seeming be
electrical-lunacy. .

I repeat again for the third time, if you key a repeater and you are NOT
licensed to operate in that band, you have generated an illegal signal.
NO IFS, ANDS, BUTS, OR MAYBES. There is no output in the ham bands on
which you may operate without an appropriate amateur license.

Cordless phones, garage door openers etc are something else.

2894. ## wanted: Rail to rail linear oscilator

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-09 00:00:00 UTC
From: techno@actcom.co.il.NOSPAM
Message-ID: <E6sux6.667@nonexistent.com>
Source record: 96295

Hello all,

I'm looking for a simple (i.e. no special I.C, just common discrete parts, CMOS gates or op-amp design) linear oscilator circuit running off a 12V supply that can deliver a triangular or sawtooth waveform with peak amplitute as close as possible to the supply rails (0 and 12V). frequency should be settable to the 100-10000Hz via a resistor/capacitor change. Frequency accuracy and linerarity are not important. Can anyone provide a pointer? Thank's.

regards,
techno

(P.S: please email directly in addition to posting here, so no responses are missed. Please remove the .NOSPAM postfix from the reply-to address (this has been done in an attempt to reduce the amount of junk mail received here from junk mailers. The correct address is techno@actcom.co.il. Thanks!)

2895. Yaesu Interface Software

>and how many times you wrap it around something, like a pencil.
>
>Thanks.
i downloaded an excellent shareware program some time ago, i think it
was called:"ECD (Electronic Circuit Design); it allowed a simple fast
calculation of an airwound coil. I dont use calculations now that I
have an RF analyser; which is quite accurate and meets my requirements.
The above mentioned program I think also allowed users to design some
pretty nifty rf filters as I recall. A shareware program I have on
my computer now is QRP Designer. Its good but concentrates on torroids
rather than airwound coils.

What if you keyed a repeater with your transmitter that was legal (below the maximum field strength and you are not licensed)? Things can get harry can't they :)

Cj> From the point of view of lightning strikes, isn't this local
Cj> distribution configuration subject to severe ground loop problems?

Yes, and it seems to me, that is the point of having the ground
and each location at the service entrance, and of that
surge suppressor installed before your meter. That way,

when the ground system brings the surge from the lightning
strike (or it's induction) from your neighbors house,
it gets to ground at your survice entrance without going
through conductors smaller than the conductors bringing it
in the first place. (Ie just the current that can flow in
half inch cable). Since your grounds are tied together,
there isn't a better ground the current wants to get to,
by flowing in through your house to your antenna's super good
RF ground. Because it's already there at the service entrance
bonding.

My question is related. I have noticed I seem to have to
change light bulbs very often in my house. Recently,
I have been operating, while watching the HV meter on the
transciever run from 117 volt lines.
It goes from about 810 to 860 volts different
times of the day. I guess that this represents load imbalance
among my neighbors houses, and that regulation would be
much better accross the 230 volt connection.
It doesn't seem to be connected with any large motors going
on or off in our house.
I haven't begun these measurements, but is this normal,
and is there much one does to correct this?

If the 117 actually goes high enough to burn out the lights
faster than normal, is there minimum specs the power company
can be asked to deliver?

Subject: Ground Rod Installation w/pipe

Regarding the use of a common point for all grounds, I've been wondering
what this means in the context of the power company's local distribution
system. I suspect I probably misunderstand how they handle local
distribution, but my impression is that you have:

- Several houses wired in parallel off of a single transformer,

- Each house grounded independently,

- All grounds connected together via long and comparatively "thin"
conductors (in the context of lightning protection),

- Perhaps additional grounds at the pole connections for user drop
cables.

From: Allen Wallace <allen_wallace@Internet.dtint.com>
Subject: Microwave Comb generator?

I'd like to build a Microwave Comb Generator. Now, I see how to drive the SRD, from reading the ARRL Microwave Handbook. But they only address how to generate a specific output frequency, while I want a comb line output.

I guessing, but I think that the output would have to a hipass filter, to remove the funamental. But what about matching? Besides, how does one match multiple octave output, except by a pad?

What's inside the 2 port comb line generators that I see advertised in the trade journals? they look like there can't be much inside!

Dig out your old text on fourier transforms. You'll find that a
repetitive
train of narrow pulses translates to a bunch of frequencies that are harmonics of the driving frequency. The amplitude envelope is a Sinx/x shape. You're interested in the main hump centered around zero. Note that as the pulse width narrows, the first hump gets wider. Also note that the energy in the narrow pulse is less, so the hump also gets smaller. So, there's a tradeoff between flatness of the envelope and the amplitude of each harmonic.

You can use a shorted (and short) transmission line to generate the short pulse. Make it out of copper plate suspended in air above a circuit board. Don't try to use the board as dielectric, it's too lossy.

You're right about having to filter the output. Even tho it looks like
a nice comb of frequencies on the spectrum analyzer, it still looks like
a honkin' big narrow pulse in the time domain. This can zap those
tiny diodes that you're using for mixers.

The Regency ACT-E-10 HLU covers 30 - 50, 148 - 174, and 450 - 470 MHz.
It has IFs of 10.7 and 0.455 MHz, and employs an AFC circuit.
Crystals may be ordered for $5 each through your local Radio Shack.

Schematic is published in Sams monitor servicing book SD-7.
For Sams Photophacts, contact Howard Sams Publishing division of
Prentice-Hall at (800)428-7267.

You'd hardly need a kit as a suitable rig need have only 3 or
4 transistors. I'd suggest 6 metres as you would require fewer
multipliers. Start with a 50 MHz 3rd overtone xtal (around 50.150 should
be OK). and build a one transistor xtal oscillator. Then build a class C
power amp. A 2N2222A is OK for 6m. Key the collector voltage with a PNP
transistor. Such a rig would put out about 10-30mW and should be OK for a
short distance.

Solid State Design had a similar rig described. It used 4 transistors and
put out 0.5 watts or so. I've worked Japan with such a rig.

Attention fans and frustrated consumers of the Usenet Newsgroups! Announcing

*** News Rover ***

No more manual shuffling through reams of useless text! No more manual decoding of encoded images and other files! No more manual reconstruction of multi-part messages! No more waiting for long downloads!

News Rover DOES ALL THIS:

o Scans newsgroups you specify while you sleep, work, and play.

o Automatically downloads messages and attached files so that they are available for instant access when you are ready to review them.

o Decodes attached files of all types (UUencoded and MIME base64).

o Displays a picture gallery of collected thumbnail size images with quick-action keys to delete, view full size, and save to permanent collection.

o Selects messages based on include and/or exclude criteria to help you find a needle in a haystack and eliminate spam. You can even use complex selection expressions with AND, OR, NEAR and NOT.

o Supports multiple "interest groups," each with sets of newsgroups, selection expressions, message database, and picture gallery.

o Remembers files already extracted and eliminates duplicates automatically.

o Saves parts of multi-part files, searches for the missing parts, and rebuilds the entire file when the last part arrives. It even combines parts found on different days and in different newsgroups.

o Operates on a schedule you set up to use your phone line only when you don't need it.

o Automatically dials the provider and hangs up the phone when it is finished.

o Works with almost all Internet providers and news servers.

o News Rover is multi-threaded so you can read messages and view pictures while it downloads and decodes more messages.

News Rover was designed and written by real-life Usnet newsgroup junkies!
With News Rover the news is ready when you are!

To learn more and download your free demonstration copy, visit:

> the
> net.

One caution with the Yaesu-5100: the data jack in the
back has a problem with severe transmit frequency response
roll-off. If you feed 1200 baud tones into it, you will need
to build an audio equalizer to make it work. About +6db of
upslope from 1200 to 2200 hz seems to work fine. The receive
response is flat (no problem). The roll-off is so bad, that
even 300 baud packet is problematic through the data jack, and
9600 baseband FSK is not workable (well, at least on mine).

Looking for a 4-1000 amplifier schematic. Anybody have one that you would be willing to copy for me or, is there data on the web someplace?

Thanks

Roger KD6CC

2907. ## Interesting scanner query

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-10 00:00:00 UTC
From: techno@actcom.co.il
Message-ID: <E6u3o8.J1z@nonexistent.com>
Source record: 96168
Cross-posted to: rec.radio.amateur.equipment,alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.homebrew,rec.radio.scanner,sci.electronics.design,sci.electronics.equipment

Hello fellow netizens,

Is there an easy way to read (by computer) the currently received frequency from a scanner (might depend on model of course), squelch status, or to program a new frequency into it? For some reason, scanners with FAST search capabilities (100 steps/sec or more) seem to always come without computer interface/control. Of course there are those hi-end scanners with built in computer interfaces. Their main drawback is usually slow search speed and high cost.
I've also heard about specific solutions (like Bill Cheek's CE-232 interface, compatible with the RS PRO-2004/5/6 scanners only. These are slow scanners and not available here anyway) but they don't fit me needs.

I was thinking of finding a signal within the scanner that changes state once (or any other fixed/predictable number of times) per frequency step, and monitoring this signal with an external computer and constantly calculating the current frequency. Does anyone know about such a signal within popular scanners (Uniden, Radio Shack, ICOM, etc.)
Maybe other methods exist too. I'd like to hear about them.

In addition, if I could find a unit with BOTH fast scan and computer interface, that would be best.

BTW, what is the FASTEST search speed available on any scanner in the 400-500MHz band, either built in or with the help of an external computer interface such as OPTO's or similar? Of course, the search step should be considered (i.e. there is a 300 steps/sec available at 5KHz steps on Unidens, but it is not available in the 400-500MHz band). Anyway, what is more important is the RAW frequency range covered per second. 300steps/sec at 5KHz steps gives 1.5MHz/sec. 100s/s at 12.5KHz gives 1.25MHz/s. So I'm looking for the maximum RAW frequency range coverage per second at 5, 10, 12.5, 15, or 30 search steps. I'm ignoring fast receivers such as OPTO's Xplorer (1 second lock!) because they capture too much junk to be useful for my needs.

Thank's for any help offered.

Driving a diode in a hunk of waveguide will do your harmonic generation and high-pass filtering. Use a surplus waveguide crystal detector. A wg below cutoff is an excellent highpass filter and does a good job of removing the fundamental. Just keep the drive below around 10dbm to keep the diode alive.

This appears to be about 8 to 9 microhenries, or an impedance of about
370 ohms at 7.0 MHz. Is this adequate for a choke-balun?

Source record: 96173

My house was hit by lightning last year. We had an orange plasma flash inside the house where it followed the corner of a vaulted ceiling. It found its way into the mains system, melting the ground wire at the entry point (I had to thread new cable, I'm keeping the damaged bit as a momento).

Fortunately, given the onset of the storm and the fact that we always get close strikes, we had unplugged most equipment (computer, TV, etc.). However, that which remained connected (doorbell, garage door opener, etc.) died. Aside from the electrical damage, it punched two holes in my roof, blew out the siding on that side of the house, split the eaves, etc. etc.

I guess it's just a natural hazard of living in central Texas (we get some quite amazing storms in the summer).

Since that event, I have become somewhat sensitive to the potential of lightning damage. Thus, whenever I don't use my Ham equipment, I disconnect the coax, put a plastic bag over the PL259 plug and throw it out the door. Then the lightning can vapourise the antenna for all I care (it's a #14 copper wire dipole - wire costs $16/500ft reel at Home Depot). It's easy enough to make a new antenna, not so easy to make a new house.

It's a pain to have to pull it in whenever I want to burn the ether, but IMO it's a fair tradeoff.

--
Cheers,

Chris. Broadbent (KC5VQL)

NOTE: My email address in this post is modified to prevent spam. Just remove the '.nospam' from the end of it if you wish to email me. It sucks that I must do this, but the amount of unsolicited crap I'm receiving now makes it necessary.

2915. Re: ## Interesting scanner query

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-10 00:00:00 UTC
From: John Montalbano <jrmont@iquest.net>
Message-ID: <3324EEB8.206E@iquest.net>
Source record: 96176
Cross-posted to: rec.radio.amateur.equipment,alt.radio.scanner.uk,rec.radio.amateur.homebrew,rec.radio.scanner,sci.electronics.design,sci.electronics.equipment

Techno,

I have modified my RS 2032 for computer control. I took the brute for approach and wired a CMOS Matrix switch across the keypad. This cost about $10.00 in parts and works just fine. I have a windows program to download freqs to the radio.

Although my interface allows me to read data back from the radio, I have not programmed it yet. There are several ways to do this. Most scanners are going to have a synthesizer chip that has a serial programming interface. I planned on monitoring the data, clock, and load signals going to this chip in the 2032 and determining the current frequency from the serial programming stream that appears on them. I would monitor the squelch signal and LO select as well.

Ultimately, I will use the same three wire interface to set frequencies during scanning.

If you would like to take on such a project and need help, drop me some mail. If you have a radio in mind and have a schematic, it would be helpful if you could send me a copy.

However, to comply with the National Electrical Code, you must connect a
wire from the shield of the coax that is laying out in the yard to the
Neutral wire in your mains inlet breaker box. -chortle-

Type-C connectors [the RG213 equivalent of BNC connectors] are easier to
connect and disconnect than PL259s, and they are waterproof, Chris.

: which you may operate without an appropriate amateur license.

: Cordless phones, garage door openers etc are something else.

You can repeat it all you want, but that doesn't make it true. The only bands where license free signals may not operate are radio navigation, radio astronomy, safety frequencies like maritime calling channels, and (showing some political pull) in the TV broadcast bands. Sure, you may only get 50 feet or so, but as far as the FCC is concerned, in the 2 meter band, a low power intentional signal and RFI from a computer are treated the same.

And there are provisions with more power allowed that have the potential for causing no small amount of interference to ham operations (like wireless lans and key fob transmitters), but it would be very poor politics to try to assert some territorial "rights" to the ham bands, as those "rights" aren't backed up by the regulations and would be very poor public relations to try.

By the way, for general information, parts of the Code of Federal Regulations are now online, including the FCC regulations in Title 47. At www.access.gpo.gov under the pages for National Archives ard Records Administration. You get to a search request form, check off the Title (47 for Telecommunications) and type in a search string. For example "part 15" or "part 97" and it returns a menu page with its best guesses that you can download with. (Part 15 came in fine as a 400k .pdf file).

AHhh yes there is....The INPUT to the rptr is the band in question..if the rptr is a crossband from say 2 to 10 or 220 to 10m FM (29.5-29.7 only), Techs AND Novices may be crossbanded..the 10m tx callsign of course must be General or above....(This is how an OSCAR is legal also!) BELOW 29.5, no retransmitting of improper class license is allowed because its no longer a rptr but a remote base....and the rules are quite different for them...

> Cordless phones, garage door openers etc are something else.
> --
> **********

Very true...they are intentional radiators and have specfic rules covering them....but they canNOT cause interference to licensed users in their band...and must accept interference from ANY source..

The 2-> 10 box is called a rptr (provided the 10mtr system is within
29.5-29.7) and is PERFECTLY legal for a TECH to use from
2mtrs...CROSSband rptrs have been around for years...as long as the
CALLSIGN of the 10mtr tx is a General or above...
Now below 29.5, its not a rptr....and cannot be retransmitting ANY 2mtr
signal automatically.....

As I recall, Don Stoner's SSB book from the 1950s had plans
for a "Compact California Kilowatt" based on a 4CX1500.
I'm sure this wasn't the first usage of the CK name, but
probably helped popularize it.

Check 900 MHz -- cordless phones

Check 2304 MHz -- ISM.

FWIW, you have an unlicensed kilowatt transmitter in your kitchen.
Jigger the interlocks and work moonbounce on 2410 simply by
opening the door and pointing it up.

2926. ICOM IC-R7100 commands?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-11 00:00:00 UTC
From: rob@pe1chl
Message-ID: <E6vvDy.CJE@pe1chl>
Source record: 96102
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I am looking for the complete CI-V command set of the IC-R7100 receiver.
It is no problem to find general docs about CI-V, so I have already built
an interface and have written a simple program that displays the frequency
and mode when the receiver stops scanning.

However, I would like to control the AF GAIN depending on the frequency
where the scan stopped. It is possible according to the user manual, and
there even is a LED on the front panel that is supposed to indicate that
the AF GAIN is being remotely controlled.
But, this command does not appear in the generic CI-V documents that I
have seen.

Does anybody have a complete IC-R7100 command set, or know where one can
be obtained?

Rob

I've used the formula (1/2 wave in ft.)/freq of interest=dipole int ft. Then Dipole in ft. converted to inches. Dipole in inches/(O.D. of conductor in inches=K ratio. Use the K in a look up data table to find K factor. I round K ratio to fit nearest .01 of K factor. Ie. ratio 441 = .94 factor (disclamer those are not valid numbers; I just pulled out of my head for illustration). I've implemented this on my HP-48 G calculator. My feelings on the whole thing is your Calcs. can be exact as significant figures allow, but a fudge factor still needs to be introduced in final physical implementation and SWR tune up, due to height over terrain, ground conductivity, feedline loss, etc... Anyone that knows of a better graph (I' m using the one out of '90 Handbook) or better method of calc, please let me know. Hopefully more precision= less fudge.

Lets hope you don't have R.F. on your equipment ground. If you do, you've
got some serious problems. There shouldn't be any R.F. traveling on your
grounding conductors.

Electrical distribution is a multiple-grounded neutral system. The neutral conductor is grounded at many points in the distribution. The safety ground in your house is local to your house. It does not go house to house. The safety ground is bonded to the neutral at one point, at the service entrance. The neutral is also grounded at the step down transformer on the pole (or underground). Your houses' safety ground is not for lightning protection.

2932. ARRL Publications?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-11 00:00:00 UTC
From: "Brian K. Short" <ke7gh@primenet.com>
Message-ID: <3325EAB2.30A6@primenet.com>
Source record: 96108
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I received an advertisement from ARRL today (and I
love to receive junk mail, really) and realized that
one can spend too much time staring at a tube (monitor).
There are many books in the Publcation Catalog that I
had never even heard about!

Not counting getting the back issues of QST on CDROM
(had to purge/recycle the hard copies some time ago)
and the 1997 Handbook (either CD or hard copy as my
copies go from 1974 to 1981 to 1987 and a *lot* does
happen in the world of ham radio in 10 years), I came
up with the following list of interesting offerings:

#5714 Personal Computers in the Ham Shack $15.95
#5854 Getting on Track With APRS $14.95
#3207 W1FB Design Notebook $10
#3851 Hints & Kinks $10
#5617 QRP Power $12
#3657 W1FB QRP Notebook $10
#4319 NOS Intro $23
#4955 Packet SPEED $15

Some seem like remarkable buys, others... Can't judge a
book by the cover either (you can quote me). Anyone have
specific comments on any of these books?

Where is the least expensive place to order these as the
total (if I were to get all of them) is over $110?

Anyone have "used" copies of any of these books for sale?
Anyone want to get rid of the QST or ARRL Handbook CDROMs?

Not that ARRL Publications are such a bad buy, I'm just miserly!

73, Brian ke7gh@primenet.com

Hi Brian:

Are you all set for BARTG? I just got my copy of Design Notes by W1FB or is it WF1B!! You can't be miserly in your quest for knowledge. It seems to me that filters for my Icom 745 are like dodo birds. I was strongly advised to buy this book and make my own. I didn't get the ARRL mailout, but if my filters work out I will have saved myself three times the price of these books. Actually other hams may want to consider building their own filters, as its seems to be nothing to spend $600 - $ 1000 for add filters these days

73 and hope to see you in the fray

In order to make the MARS MOD to the Knwd TS950SD, you just clip 1 of 3 diodes. If you know of this, what are the OTHER TWO for? you suppose there is something of benifit to be gained in just clipping one at a time and see what happenes or would there be irreparable damage?

Someone in California heard about a G building a 400 watt amplifier around an 813 with 4 KV on the anode and got jealous. He scrounged a slightly warm 4CX25000 and built a 1000 watt amplifier. He thought the 1 KW rating was for the filament dissipation.. After special 3 phase power installation from Pacific Gas and Electric, he ionized the atmosphere all the way East to Phoenix...hence the name CK.

And now you like know, y'know.

Last year on one of the "shack" cover photos on CQ Magazine, you can see at the end of the operating bench a 30 Amp plus Variac and next to it a 6ft "California Kilowatt". I'm sure the Variac was keeping the AMP within legal limits:-) Not for busting pile ups. BTW it was not a 6 call. 73

Live Maine lobsters freshly shipped right from the wharf
to your home or business Overnight. They make a most
memorable gift and they're mighty tasty too!

Our lobsters are specially packed in a reusable
waterproof cooler and ice pack which can also
be used again. Shipped daily overnight by Federal
Express. You can't get any fresher than that.

To place an order, kindly call 1-800-456-0133,
24 hours a day, 7 days a week. Gift Certificates
are also available on any one of the Lobster Parcels
described below.

Everything is included in the prices - packaging,
overnight shipping, lobster cooking & eating instructions,
and tax. We can even include a personalized message card,
especially if it should be a gift. Sure is better than always
sending flowers or candy.

Please have your Visa, Mastercard, or American Express
credit card ready when calling. Thank you kindly!

All orders to be shipped for next day delivery should
be called in by 12 noon EST. Saturday delivery is
available, just add $10.00 to any order.

Lobster Parcels offered are the following:
(remember everything is included in the price,
even the overnight shipping)

All lobsters are 1 and a 1/4 pound each or slightly more.
The toll free number again is 1-800-456-0133.

Lobster Parcel #1 - 2 lobsters - $64.95
Lobster Parcel #2 - 4 lobsters - $89.95
Lobster Parcel #3 - 6 lobsters - $109.95
Lobster Parcel #4 - 8 lobsters - $129.95

Thank again from EzXpress, Home of the LobsterXpress.
Enjoy!

baggybobs' buck a bag bargain bonanza
brought to you by bob & kim.

Surface mount parts for experimenters/prototypers
all new surplus unless otherwise noted

Shipping to the USA
Small parts orders (less than $35 usd). I ship by priority mail. Cost is $3

Larger parts orders I will ship by UPS using an agent. Cost is $5
I ship UPS COD only upon receipt of $10 deposit. The UPS depot is 60 Km
away. I have to drive there and handle CODs myself. I cannot afford the
cost or hassle of refused COD shipments.

Really small parts orders (up to $5 surface mount parts only). Send me a
SASE with three stamps. I will put in some foam filler to prevent damage.
International orders require international money order or funds drawn upon
a US bank. We can determine together the best way to ship.
.
If you have tech questions please e-mail. I will answer in a day or two.

baggybobs' buck a bag bargain bonanza
brought to you by bob & kim.

all new surplus unless otherwise noted

Shipping to the USA
Small parts orders (less than $35 usd). I ship by priority mail. Cost is $3

Larger parts orders I will ship by UPS using an agent. Cost is $5
I ship UPS COD only upon receipt of $10 deposit. The UPS depot is 60 Km
away. I have to drive there and handle CODs myself. I cannot afford the
cost or hassle of refused COD shipments.

Really small parts orders (up to $5 surface mount parts only). Send me a
SASE with three stamps. I will put in some foam filler to prevent damage.
International orders require international money order or funds drawn upon
a US bank. We can determine together the best way to ship.
.
If you have tech questions please e-mail. I will answer in a day or two.

Leaded parts. Surface mount parts for experimenters/prototypers are in a
different message

Digital-to-Analog IC DAC08030 from National Semi. 8 bit CMOS with double
buffered output. .05% linearity. 20 pin DIP package, works on single supply
Most parts have house marking but guaranteed to be as represented. $1 ea

15 pages of data sheets and suggested circuits $ .50 but no charge if you
purchase 10 or more parts.

Voice synthesizer. Phillips PCF8200 used in applications with
microprocessor. Speech code stored in memory. Programable speaking speed in
male or female voice. Single 5 v supply. 24 pin DIP
3/$1
data sheets and application notes 14 pages $.50 but no charge if you
purchase 15 or more parts.

Schottky barrier diodes in quad ring configuration. Used for balanced mixer
at 800-900 MHz NEC part # ND487R1-3R. 10/$1.00
I can only find a 1 line description for this part in my NEC catalog. The
first person to send me a mfgr's data sheet on this part will get $10 of
parts for free. (your choice, not valid for shipping cost)

Hirose microphone plug. Used on many imported HTs $6 ea
Hirose # SR30-10PE6P 6 pin plug with threaded lock. Has 5 notches on shell for indexing. Look in Digi-Key catalog for picture

Motorola 6 unit rack charger-battery conditioner for STX portable batteries. Model PLN 1193A. Also have one for MX radio Model PLN1157A. Like new.....never put into service. Copy of manual included. $200 ea plus UPS shipping.

Motorola Intellicharger desk charger for any flip phone or Elite. Rapid charges both NiCd and NiMh batteries and then switches to pulsed "top-off" mode to prevent overcharging. Holds two batteries. Very good condition includes wall transformer. $35

Motorola Intellicharger for brick phone. Works same as above but only one pocket. $30

Switching supply plugs directly into wall socket (US or Japan). About the same size as computer mouse. Well filtered output 1 Amp @ 7.5 V or programable up to 10.5 volts using external feedback resistor. Input 100 to 240 volt. Made by Anam, Daewoo, Phihong and others but no choice because I don't know who made what. Output cord is about 4 foot long with leads at end. May have cosmetic blemishes so I'm not calling these new. $8 ea or 2 for $15.

thank you

Actually, I'ld prefer putting your PL259 onto a SO239 that's grounded on both connectors
(read that shorted on both sides to ground). No static build up that way,
less possibility that you will have to replace your wire too! -art clemons-

I have a library of tech data gleaned from ham mags and electronics
mags..it is quite comprehensive. one watt to 5 watts is quite easy to
achieve; you could use a simple one transistor design and a few
handwound coils and capacitors and youre laughing.I built a RF
sensing TR switch for my lil 2 transistor 2 mtr amp and if I can
scare that up too if you wish. 73 earl /...earlve3ab@igs.net

2952. MINI-REVIEW: CPCW-5 xmtr

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-11 00:00:00 UTC
From: bry@mnsinc.com
Message-ID: <5g3frg$f8r@news1.mnsinc.com>
Source record: 96193

Someone please copy this mini-review to QRP-L

Here is a "First Impression" of the new CAKE PAN CW-5 transmitter
that arrived today.

It is a new TUBE product on the market for hams! What a great way for
all of those new NO CODE TECHS and other beginners to get their feet
wet with a REAL RADIO!

The radio can be bought assembled or as a kit. It comes with a really
good manual and plenty of helpful instructions. Mine was already
assembled and worked great right out of the box. I was on the air
within 10 minutes.

This CW transmitting device uses a specially designed
tranformer that is made just for this rig, plus a 6C4 - 6AQ5 tube
line-up, plug-in coils and a PI-NET output. There is plenty of room
on the chassis for your own mods or add-ons, and later this month
they will begin offering an AM version of the rig, or a modification
kit to add modulation to existing rigs.

I can see adding a semi-break-in circuit, maybe a relay for keying
from my memory keyer etc, later. For tonight I just used the straight
key.

This rig is destined to become a classic!
Once I figured out which tube went where and got the 6C4 and 6AQ5
tubes plugged in OK, I realized that the OTHER 7 pin tube socket
is for the crystals to plug in! A novel approach. I had seen
something like this done with FT-243 crystals in Octal tube sockets plenty
of times.

I plugged it in and
connected an antenna (G5RV and MFJ-949D tuner) and plugged in the
crystal for 3640 kHz that came with it. No one around so I tried a
CQ. It only has ONE tuning control (plate variable) - the PI-NET has
a fixed cap on the antenna side. No problem getting a full 5 watts
out right away (according the notoriously inaccurate wattmeter used
in tuners of this type) - but certainly in the ballpark of 5-6 watts
out all of the time. The rig tunes nicely and has a good note.

Some RTTY signal is hogging the frequency and I get no replies to my
CQs, so I plug in the 3700 kHz rock and move up the band.

SO at 0042 UTC I put out my first CQ on 3700 and got a reply from
W8TMS in TROY, MI - DX!! AND he gave me RST 599! Not bad for a
maiden viyage on the CPCW-5.

Later on I heard K3JO nearby calling CQ and gave 81 year-old Jules a call. He came right back and chatted with me for 35 enjoyable minutes. My report was RST 579 From Narberth, PA up near Philly using his homebrew 2-tube rig with a 6DQ6 final pumping 25 watts to an end-fed wire.

Later at 0135 UTC I tried a CQ again, and got a call from KR4LE. THe band was
getting noisier now, but Emery got me RST 599 in Richmond, VA

My last QSO of the evening came at 0211 UTC, again on 3700 kHz with KB1MJ up in Dedham, MA running a Heath HW-9 QRP rig. Conditions were awful but Paul and I toughed it out!

I hope to work many of you soon with my delightful new glowbug here! I will be QRV evenings on 3640 and 3700 kHz with the CPCW5 rig from VINTAGE RADIO KIT COMPANY.

If you are interested - contact Carl, WB1EYE who supplies these kits at:

427 N. Main Street
Sharon, MA 02067

or you can read more about it on my web pages at:

http://www.mnsinc.com/bry/hamfiles.htm

I have no financial interest in this company - just a happy user of their product.

Anyone else using one - please contact me via e-mail at:

bry@mnsinc.com

72 to all - Bry, AF4K in Gaithersburg, MD

Hi David
I have the complete data, infact my book is so old it is listed as
advance information!
The data sheet is in fact 6 pages, and I can fax it, if you supply me
with your fax no!
BTW this was looooong before GEC came into the picture..... the
databook was printed 1982.

2956. WTB: Motorola Code Plug 151.4hz

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-12 00:00:00 UTC
From: Vic <vgadzik@vivanet.com>
Message-ID: <33269AF1.4740@vivanet.com>
Source record: 96048

Need the tone "code plug" chip for Model HLN4181A, found in Mitrek UHF
radio. Need freq 151.4 only.
Have 107.2 for trade, if you need that tone.

Tnx, Vic AA2YW

aa126@fan.nb.ca (William Burrow) wrote:

>Does anybody know the characteristics of IEEE 802.3 thin ethernet cable?
>Is this useful for ham applications?

The heading contradicts the content...
IEEE 802.3 thin ethernet cable is just the regular thin 50ohm coax
(RG-59 I think) or maybe a little better since it's under IEEE control
(I know the IEEE802.3 THICK coax is really high quality, since it must
have strict quality control to allow tapping into it at many points
,up to 30 low capacitance taps per 100 meters. On the other hand, it's
designed only for 10Mbps, not VHF/UHF) .
The heading talks about Cable Television Coax, which here is a white,
low-cost coax feeding CATV signals to the home. Gut feeling: it's not
so good (since it must be cheap and they have lot's of amplifiers
along the way). Yes, I guess someone will have to run a test on this
cable...
Just my 2 cents...

2960. ARRL Handbook wanted for Prison Library

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-12 00:00:00 UTC
From: bahaus@micron.net
Message-ID: <33264358.2923822@news.micron.net>
Source record: 96120

I teach GED classes inside a prison in Oregon, and I have several students who have an interest in electronics and amateur radio in particular. I would like to know if a ham operator out there might have an older, outdated ARRL handbook he or she might be interested in donating to our prison library. If you would like to help us out, I'd be glad to send you the library's address. These men have rather limited access to books and specialized reading materials such as manuals and handbooks, so if you could help, it would be greatly appreciated. I don't often get to this group, so if you could e-mail me, I'd appreciate it. Thanks.

Hi - I need some ECL80 and ECL82 and ECL86 tubes please.

U.S. equivalents are 6AB8, 6BM8 and 6GW8. Anyone have these?

This is to build some simple 1-tube QRP transmitters I want to try.

Anyone have some they don't need? E-mail me please.

|>a 7th grade class project? thanks markw@iconnect.net N9OHS

Hi there Mark - you can find a BUNCH of sources for kist like that at my web site:

http://www.mnsinc.com/bry/hamfiles.htm

Then click on KITS for the list of sources. Many of these folks have catalogs listing small radio transmitter kits, FM wireless mikes etc. "Walkie-talkies" are not so common but I am sure you can find something suitable. Some of the kit catalogs are geared toward school students too!

ICOM America sells a book titled the CI-V Reference Manual for $ 15.00
plus shipping and handling. It does have the commands for the R-7100
included in that book. Later radios now have the command sets
included in the instruction manual for each radio.

Message-ID: <85256458.005014BB.00@hqoutbound.ops.3com.com>
Source record: 96126

Gang --

Maybe someone should put this in a FAQ somewhere

Once and for all: Ethernet coax is OK. It's 50 ohms.
The yellow stuff is basically a bit better than RG-8.
It has double shielding and a #12 ga. solid copper
center conductor. Bend radius is about 2 ft.
The thinnet is an average RG-58. Crimp-on N and BNC
connectors are available. Crimp tools are cheap ($50).

Loss per 100 ft in table below:
(4 digit numbers are Belden part numbers)

Belden 9880 Yellow Ethernet Cable
Belden 9907 Thin Ethernet Cable
loss vs. frequency compared to
Belden RG-8/U, Belden 9913 and Belden RG-58

Freq E'net RG-8 9913 Thinnet RG-58
MHz 9880 8214 9913 9907 8240

1 0.19 0.14 0.1 0.43 0.3
10 0.52 0.51 0.4 1.3 1.1
50 1.20 1.2 0.9 2.9 2.5
100 1.70 1.8 1.3 4.2 3.8
200 2.55 2.7 1.8 6.1 5.6
400 3.90 4.2 2.7 8.9 8.4
700 5.50 5.8 3.6 12.1 11.7
900 6.50 6.7 4.2 13.9 13.7
1000 6.90 7.1 4.5 14.8 14.5
4000 18.0 11.0

Information from Belden "Master Catalog"
(c) 1995

Belden Wire and Cable Comapny
POB 1980
Richmond, IN 47375

(800) BELDEN1
(800) 235-3361

You may also find some orange teflon covered stuff. It has the same
characteristics, but a smaller OD. Belden also makes several
different RG-8 and RG-58 variants. Their characteristics vary.
I've chosen the "best" but a Belden catalog is a good thing to

have, if you're splitting dBs, or want to know the characteristics of a certain Belden product.

I don't work for Belden, or have any financial interest other than some of their cable in my basement.

2969. Which size torroid core?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-12 00:00:00 UTC
From: "Todd W. Schifferdecker" <tws@surface.com>
Message-ID: <01bc2f03$89722da0$f30afe26@tws-pc3.surface.com>
Source record: 96129

Greetings,
I am building a switching power supply,
Input 8 VDC,
Output 10-12 VDC, 30 Amps
I wish to use a step-up transformer wound on a torroid. Can someone give me some guidelines on which torroid core to use? I understand that I can use a smaller cross section if I raise the frequency. I plan on using Logic-Level FETs to drive this transformer. I understand that there will be an upper limit on the frequency I can use due to the switching characteristics of theFETs. I wish to use the smallest torroid possible. Some guidelines on frequency and torroid core size would be appreciated.

Thanks,
Todd Schifferdecker

Hi:

Heathkit used to make a gadget called a microlyzer. It allowed you to change the base and treble of your voice before it was fed in to the rig. I use mine the opposite way. I lower the base and raise the treble to max. That way DX thinks they are working a YL!

2972. Help wanted for the Pixie-2 Transceiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-12 00:00:00 UTC
From: markv@pixar.com
Message-ID: <5g6u09$da@pixar.com>
Source record: 96132

I was assembling the Pixie-2 transeiver kit that I got last weekend (these kits are made up by HSC). All was going well, until I went to install the inductors. L2 and L3 are fine, but L1 is supposed to be a 15-22 uhenry inductor. The color coding on the inductor looks like orange-red-black to me, which indicates a 32uhenry inductor. Has anybody else had this problem? What problems am I likely to incur if I install this inductor? (I am a total amateur at this kit assembly stuff).

Thanks in advance -

>am all eyes'n'ears re instructions and/or schematic ommisions/errors.
>What kind of real RF o/p would this unit have using FM???

Ten Tec claims this unit is really intended for 50-52 MHz and FM coverage is not specified or to be expected.

That said, my transverter is capable of transmitting to 53 MHz with no problems. I use my TS-50, with transmit frequencies unblocked, in FM mode, and it worked pretty well up to about 53 MHz. After that, the power dropped off, as did the receive sensitivity. Six meter simplex should be quite do-able.

e-mail me if you want further details.

From: Robert Lyons <boblyons@umich.edu>
Message-ID: <3327143A.6AB@umich.edu>
Source record: 96135

I'd like to adapt a published circuit for an FM broadcast-
band transmitter, to be used as a flea-powered foxhunt xmtr
on the 2M band. Can anyone tell me the rules regarding such
transmitters? For example - must the control operator be
present at all times, or are there provisions for automatic
operation, perhaps under the regs for operating a beacon?
There are a number of newly licensed sub-teenagers in the
neighborhood, and I think they'd enjoy a "micro-foxhunt" in
one of the neighborhood parks, if I can figure out how.

Bob Lyons, KI8AB

OKI have a Speech Pitch Controller chip, the MSM6322GSK, that should do
what you want. It costs #10.20 (UK) from Maplin, and the circuit is in
their current catalogue. You can shift the pitch of input speech in 17
steps either one octave up or one octave down. Maplin is on 01702
554000.

Standard Radio ?)

Im in search of the following parts/pieces :

1. - Owners manual (or good photo-copy)

2. - Ni-cad battery pack (any cond. as long as the shell is OK)

3. - Belt Clip

4. - Charger

I will pay with a USPS money order if the costs are reasonable.

Thanks & 73's ..... Roger N9PMC :-)

2980. FS: Kenwood YK-455C-1 500Hz Filter , Lower priced.

Don't get too happy. I just got an R-8500, and the listed control codes are <WRONG> They don't work. I wasted a whole day on it, then after much "please hold" from Icom, they tell me "Oh, you need the old codes, they are in our extra book."

Whathell is going on here? That RX wasn't on the shelf for more than 2 weeks, and they are telling me that the codes on the printed manual (that takes about a month lead-time) are NEWER than the software in the rig???

After waiting another day for fedex, finally I have the right data in hand. What a mess!

It's a nice rig, but as usual, the manuals bite.

If you would like a FREE copy of a
just released business kit called:

"THE COMPLETE INTERNET BUSINESS STARTER KIT"

Please read this short message! I am giving
the kit away FREE for the next 5 days.

A typical day for an On Line Entreprenuer...

Wake up 9:00am, warm up a pot of coffee... you push a few
buttons... and your computer makes that familiar sreeek sound...
the connection is made. You check your e.mail, good news: you
have 17 new orders since you went to bed last night.
There is no need to rush... your morning commute only takes
15 seconds.

If you want to make money from the internet you MUST
get this just released business kit called:

"THE COMPLETE INTERNET BUSINESS STARETER KIT"

This kit was designed to reveal the inner most marketing secrets
of the on line world. The only tools required are a computer and a
modem. In it, you will learn the following techniques used by
Professional Internet Marketers.

** The Income Potential from Internet Marketing can set you
free from the rat race and free from a tedious and stressful job.

** You can start part time from home. Work at your own pace

**You do not have to risk any money to get started in
this exploding industry

**No personal contacts are necessary. No face to face selling!
If you can use e.mail you should be making money hand over
fist on the internet

**Take advantage of this 21Century Technology, Today!

**This is a researched, proven, legitimate way to
tap into "THE GOLD RUSH OF THE 90'S"

And get this... When you get our amazing kit you will also
have UNRESTRICTED AND UNLIMITED REPRINT AND
RESELL RIGHTS.

You could earn thousands of dollars by reselling our amazing kit. Imagine the possibilities!!

For a FREE copy of the

"THE COMPLETE INTERNET BUSINESS STARTER KIT"

you can e.mail the publisher's auto responder and recieve it within 30 seconds! Simply send an e.mail to:

detailsnow@answerme.com

Then simply print out the kit and you will be on your way to financial independence and free to live life!

Good Luck!!

It's quite useable. The 100% shield keeps CATV service ingress and egress to a minimum and loss at 2m and 70cm is very acceptable - after all its to be used to 800MHz - I couldn't measure it with a Bird on a 100 foot run at 2m - no 440 slug. The impedence mismatch 50 to 75 is only a 1.3:1 SWR if you can actually measure the feedline versus all the other possibilities. It also works fine at HF - I've used only 5/8" heliax (flea market tail ends) or CATV for HF feedlines (to balun at antenna) for years - the 100% shield really cuts the static pickup from dimmers, acquarium thermostats, Fords driving down the street, etc. when you live in the city centre.

Trick on standard CATV drop cable is to use the F connector properly crimped and then an adaptor to UHF or N - the aluminum foil shield is hard to work with into one of these connectors directly. I learned this the hard way - it took Mac VE9IM / VE3OS to set me straight and lend me his crimping tool.

And the price per meter is usually right. 73, George VE3YV / K8HI

Two comments....
I believe these are NOT very linear (designed for cellular service) and
may not provide acceptable service for AM ATV... FM - great!

I have used "out of band" bricks successfully in the ham bands, but on
some occations, had to tune the length of the input coax to make the
brick accept drive.

Have fun! Woody

Dana, We have several 2M repeaters that have switched to PL
squelch because of nearby scanner Local oscillators kerchunking the
system as the scanner runs. Remember 144.xxx + 10.7 (typ scanner i.f.)
equals 154.xxx (typical scanner rx freq.) So the potential is there
if you are unluckey enough to come up with the right combo in your area.
One group even offered to buy one gentelman a new scanner with a
different I.F. freq, He declined. As far the legal aspect goes anyone
who thinks the FCC will do anything about anything where a LARGE fine
is not involved your kidding yourself, we are on our own. As far as the
10M link goes I believe the repeater trustee is responsible for all
emmisions and the transmitter is operating under his call and
privledges so the tech can do his thing and come out 10m on this
machine. If I'm wrong the airwave cops will admonish me on this. (ha)

Yeah, nobody is making these things anymore. I did see a blurb in
rec.antiques.radio+phone a while back that there are one or two custom
rebuilders who will put new elements in your old can. Maybe someone can
come up with the name (maybe try Yahoo or Alta Vista for capacitor
rebuilders?)

No the commands are correct except for one and that addendum should
have been included with your radio, if not contact ICOM for it. Many
software companies are not haveing troubles with wrong commands in the
R-8500.

Chris

Helper Instruments once made a portable service monitor. The bases for this monitor was a scanner. Helper merely blocked with a front panel plate the unecessary buttons such as the scan buttom. The scanner looked like an early version of a bearcat or regebcy. The monitor worked fine, used on for several years as a portable monitor for service calls. The monitor wirked as you described above from nearby scanners.

Put a voice or CW id on it, but I wouldn't bother with automatic control,
just keep a control operator within 10-15 minutes away. This should
suffice the control requirment.

depends on how automatic. i have a remote base on my 6m, 440mHz
machine.
while it certainly doesn't repeat all the time, it does when i want it
to.

Hey! That's great your building this rig. I've
found very little information on similar, simple
projects for QRP. I've been all over the net
and most everyone wants you to BUY!

I would go ahead and put it in. This inductor
will most likely improve response in the 80 M. band.

If you wish, use a small low frequency torroid
and wind 6-10 turns of 22 AWG wire on it and see
what you get. It worked fine for me with 6 turns.

As a direct conversion receiver/xmtr, you'll notice
the oscillator beat on a nearby receiver. Also you
will probably get a nearby AM Radio Station if you dont
change the output capacitor to 100 pf. You absolutely
must use a resonant wire with this one. I found that
a 66 ft end fed or a dipole with 33 ft. legs works great.
If you play around with a short antenna you'll think
there's something wrong -- the local AM broadcast station
will be overpowering! Don't do any troubleshooting
until you've got it hooked up right.

One more thing, the keying wire is in series with
the output/mixer transistor and the DC resistance of
a long connection to the key will adversely affect
output power. Keep it short or start looking for
a switching transistor to bypass the 10 K ohm idling
resistor (it is used for receive mixing).

If you need any more information I can email
you the original circuits and a 700 Hz RIT/XIT mod
I found on the web. Unfortunately the mod forces
a +/- supply, requiring another battery.

72 de WE6W QRP .3 Watts QSX 7040 KHz.

Protoboards for sale:

3 x stradle boards (48 rows of 5 connects on
each side of the center stradle)
4 x bus bars (same heigth as the wide boards)
Instructions & screws to mount all seven.

Mouser sells equivalent boards for about $29.37.
I'll sell you everything for $20+shipping, prepaid.

>
> Gary

It's more than one. I don't have either the rig or manual at this
location yet, they are with the programmer, but I'll detail what
was different as soon as I can.

Maybe I'm picky, but I called ICOM to verify the manuals, and
specifically
asked for addendums or changes, and was told there were none.
Much hair pulling later, they remembered this tech manual with
what they called "the old codes" and claimed the manual
documented the "new codes".

All I know at this point is the programmer is running just fine now,
and I expect a beta version probably next week.

Maybe someone can post the commands from an R-8500 manual, so I can see
if the R-7100 uses a subset of those commands?
(or even better: the R-7100 commands as listed in that Icom ref manual :-)

It's pretty simple to build a 10min. timer with a 555 IC also, that way
when the radio is triggered after 10min you either have a CW id or voice
id.

TTYL,
Mike

If you would like a FREE copy of a
just released business kit called:

"THE COMPLETE INTERNET BUSINESS STARTER KIT"

Please read this short message! I am giving
the kit away FREE for the next 5 days.

A typical day for an On Line Entreprenuer...

Wake up 9:00am, warm up a pot of coffee... you push a few
buttons... and your computer makes that familiar sreeek sound...
the connection is made. You check your e.mail, good news: you
have 17 new orders since you went to bed last night.
There is no need to rush... your morning commute only takes
15 seconds.

If you want to make money from the internet you MUST
get this just released business kit called:

"THE COMPLETE INTERNET BUSINESS STARETER KIT"

This kit was designed to reveal the inner most marketing secrets
of the on line world. The only tools required are a computer and a
modem. In it, you will learn the following techniques used by
Professional Internet Marketers.

** The Income Potential from Internet Marketing can set you
free from the rat race and free from a tedious and stressful job.

** You can start part time from home. Work at your own pace

**You do not have to risk any money to get started in
this exploding industry

**No personal contacts are necessary. No face to face selling!
If you can use e.mail you should be making money hand over
fist on the internet

**Take advantage of this 21Century Technology, Today!

**This is a researched, proven, legitimate way to
tap into "THE GOLD RUSH OF THE 90'S"

And get this... When you get our amazing kit you will also
have UNRESTRICTED AND UNLIMITED REPRINT AND
RESELL RIGHTS.

You could earn thousands of dollars by reselling our amazing kit. Imagine the possibilities!!

For a FREE copy of the

"THE COMPLETE INTERNET BUSINESS STARTER KIT"

you can e.mail the publisher's auto responder and recieve it within 30 seconds! Simply send an e.mail to:

detailsnow@answerme.com

Then simply print out the kit and you will be on your way to financial independence and free to live life!

Good Luck!!

The CI-V reference manual listed commands for all prevoius radios that
had the CI-V command set available to them.

It is recommended to those whom need some more assistance with the
command set that the radio instruction manual provides. The CI-V
Reference Manual goes further than the product instruction manual does
in explaining the commands and how they are used.

The CI-V reference manual is for out of date radios. Now ALL of the
commands are in the radio instruction manual. One will need this CI-V
Reference manual for writing programs for radios prior that the
IC-820H.

And yes all of the available commands are in the R-8500 manual and
are correct except for ONE command. ICOM is correct there are no
updates for the command set on the R-8500. I know of 4 programmers
who are NOT have any difficulity programming the R-8500 with the

supplied command set in the instruction manual. Geez even U.S. government agencies are finding the command set to work fine.

I would be interested in your findings, please report them to 75540.525@compuserve.com

Gary

I was given (for free) an old Lettine Radio 6-meter a-m transmitter
this week. It's rough, but potentially restorable. It's crystal-
controlled, uses a 6146 in the PA, a 6V6 speech amp, and two 6V6's
in the modulator. Does anyone have any information on this unit?
I don't know what the model number is (the paint is flaked off in
that area).

What the heck... if I can't find any info on it, it will supply
lots of great parts for my junkbox...

3018. Wanted: Manual TenTec Corsair II

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-14 00:00:00 UTC
From: W.B.Mudde@net.HCC.nl
Message-ID: <332b667e.1318364@news5.inter.NL.net>
Source record: 96080

Hello OM, I have bought an TenTec Corsair II, but do not have the manual
and/or service manual. Who knows how to become this manual ? I can pay
by creditcard or by sending green stamps.
Thanks in advance,

Bart Mudde PA3GGM
Ds. Schoutenlaan 3
4797 CC Willemstad

>
As an experiment, I connected a cordeless phone to my phone patch. By
setting the rig on vox I could talk/listen through the cordless phone
from about a block away. It worked quite well, altough I didn't have any
way to change frequencies, but no reason it could not be done.

This is not really amature radio, but I know you probably know how to do this.

I want to build a small AM or FM transmitter. I want to have it transmit around
a mile and as small as possible. Does anyone have schematics for something like that?
Or just want to help a guy who has been looking for months and cant find anything he can use.

Source record: 96084

Hello, Doug:

I took the rig(IC-706) have no change to government to get
approval but failed. The officer said that my rig's receive frequency
must lower 146Mhz. I removed D60 and
installed it at D58. The transmit frequency can change to 144-146Mhz but
receive change
nothing.I removed D58 and install it at D57.The HF transmit frequency
have little
change and VHF within 144-146Mhz.The receive frequency still have no
change.I think that the D57,D58,D59,D60 just change the transmit
frequency.I think it will have some
diode to change receive frequency. Would you send me some information
about the diode
that the microprocesser use to change frequency?
If I can not change the receive frequency that suitable to
grovernment, my rig
will become a rubbish.I spent about 4 months and HK$7300 for it :-(.
Best Regards, Freeman(XX9ER)

Wright. The 1/2, 3/4 or more inches CATV "hardline" today are
1GHz rated. I sweept some 75 ohm cable, from 1MHz to 1GHz and found
in some cases a kind of "ringing" between 500 and 800MHz. This ringing
means bad cable construction.
A 100 feet of 1/2 cable have just 1.59dB loss at 450MHz; the same
lenght of 3/4 inch cable have 1.08dB at the same frequency. It's 1GHz loss
is 2.46 and 1.68dB. So, just cut such cables in electric 1/2 wavelenghts
that
the line mismatch go away.

> The impedence mismatch 50 to 75 is
> only a 1.3:1 SWR if you can actually measure the feedline versus all the

> the hard way - it took Mac VE9IM / VE3OS to set me straight and lend me
> his crimping tool

There is a CATV acessory called "splice-block". This block fits
the CATV standard 'PIN" connectors. It's threads are the same used at PL
259 and N connectors. What I did? Dissassembled some back-to-back PL
259 and N connectors, removed the center pin, solder the PIN CATV center
conductor to it and attatched to this "splice-block". Clean job,
mechanichally
well solved, water and RF proof and return loss guaranteed up to 1GHz
(according with the manufacturers).
Remember that most cable spans means that the CATV companhy
is unable to use all the reel content (normally 760 meters). So, sometimes
there is 30, 25, 45 meter left apart, may be some damage on it that make
them
useless for broadband applications but usefull for us.
For RG59 and RG11 there is BNC an N connectors avialable, crimping

family.

>transmitters?

Will it be xtal control? If not, I'd worry about how stable such
a device would be. The folks searching for such a "fox" will be
a bit disappointed if the fox's signal keeps wondering in and
out of their HT's passband. Maybe conduct the fox hunt *on* the
broadcast band and let everyone use Walkman's!

3029. FREE: 8051 SBC development system

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-14 00:00:00 UTC
From: Mike Swaney <mikesw@pop3.harborcom.net>
Message-ID: <3329F5C9.AAF@pop3.harborcom.net>
Source record: 96091

I have an 8051 Intel SBC assembled from a kit. It appears to be well constructed but requires an outboard P/S. It has a TTY type membrane keypad, a two line alpha display, RS-232 port, cassette port, and more. I have the original manual for it in a binder. If you want to get into this device on a budget this might be just what you need. The priority mail rate for this should not be more than $7. Call Mike after 6PM weekdays / whenever on weekends (216) 257-6352 or email me here.

Source record: 95998

Ramsey makes a good little 2 meter Xtal controled FM Mike. Just nip the mike and key the final multiplier. Its real small using surface mounted parts, so I hope you have a good iron!

I use the thing for tracking my High Power Rockets.

Why are you teaching them code anyways? :-)

Sounds like you are doing a great job of teaching them Tech!

>like that?
>Or just want to help a guy who has been looking for months and cant find
>anything he can use.

Sounds like you should look into the 1,750m band (160kHz to 190kHz).
It should be fairly easy to build a DSB AM transceiver for this band
(and if you block AF from the mic, you should be able to use it for
morse code [which will reach farther than AM, since you're putting
more energy into the carrier, instead of the sidebands]). Should be
fairly cheap, too.

I am currently trying to build my own HF rig; however, it'll also
support the 1750m band as well (just because I'm curious!).

E-mail me, and I'll send you my block diagram, and what schematics I
have so far... :) Be sure to tell me what image format you prefer
(GIF, IFF ILBM, etc.).

3036. Transformer Recommendation?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-15 00:00:00 UTC
From: falvosa@borg.com
Message-ID: <5geq75$t41@ns2.borg.com>
Source record: 96003
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.homebrew
Body handling: 1 inline base64-encoded payload block was not displayed

I'm looking for a transformer, with a two-to-one _winding_ ratio, that can handle both HF and VHF frequencies. Schematic as follows:

```
__
) __
__) (
) (__
__)
```

As you can see, the winding with the greater turns needs to be center tapped for my application. The transformer needs to be able to handle about 15W to 20W of RF power for safety reasons: I'm going to pump no more than 10W through it.

If anyone has a recommendation, please e-mail me or follow up on this newsgroup. I'm looking in particular for part number, manufacturer or order-house, price, and how I can contact them. Many thanks in advance!

> would be appreciated. k2mmd

Assuming that this is not a trolling dx-pedition, suggestions:

1) Have lots of AC power available.
2) Install forced air cooling.
3) Don't use small gauge wire for the antenna.
4) Move to the country.
5) Don't use your real amateur call-sign; or
6) Remove Final Amp tubes and only use the exciter.

On the serious side, if these are the same rigs I've seen in military
COMSTAs,
they are a little bit on the QRO side for Ham applications. If I'm not
mistaken, they are 10 KW and 3 KW (Output!) respectively. I suppose you
could throttle them back a bit. The AC power requirements tend to be on
the
commercial end - 240/3-Phase or some such thing. The cooling,
especially
for the bigger rig, requires a lot of air movement. Aside from that,
they
would probably loaf along just fine in the average contest pileup. ;-}

Check out the site at http://www.high-voltage-assoc.com/
[High Voltage Association]
They include companies like Plastic Capacitors Ltd, who are well known
for high voltage capacitors like the ones you want.
Amateur radio sources (rallies, clubs, suppliers, magazine ads) exist for
these items second hand, but beware older types which may contain hazardous
PCB (poly-chlorinated biphenyl) instead of oil. It might also be worth
looking for some second hand possibly non-working high voltage power supplies
containing suitable capacitors through Amateur sources.

Any of you homebrewers out there know anything about pagers? i'm gonna recrystal this one [a yard sale find with no docs!!] for use with tnc and such. nice CQ vhf article on this subject.

the question is: how do i find out its activation code. i remember seeing somewhere that there is a way to make it give me the information. i don't even know the model number. it has the standard beep and vibration type alerts. a backlight and displays the time.

it does say 152.4800 and 1200 baud on the back so it's a vhf type. any help out there?

I wish to convert a A.W.A. Model RT80 Type 2-M 82004 transceiver with a frequency coverage of 450 - 485Mhz to 438Mhz.
If anyone has had experience with this task I would appreciate any advise and or references that can assist. I believe that a change of crystals and modest retune may be all that is required.

Regards

Are there any investors that can talk to an inventor
without trying to grab the goodies free?

I haven't seen any.

I, BTW, am WB0NRU, and my QTH is domewhat
displaced. I live in Tulsa, 5-land. My call became
a zero area in '75 or so, and I was five years or more
learning not to give my old 4-call.

So, When I moved to 5 country, I kept the zero call.

Nothing wrong, of course, with my
brain
brai
bra
br

but I do
lose track.

For this reason, I like most other prolific inventors,
cannot sell or manage a business, wherewith
leaving myself in the cold.

I have discovered a way to xmit music over a
bandspread of =< 100 Hz. Note that is Hertz
not KiloHertz.

I cannot talk well in a face-off, so I blow it every time.
Any suggestions?

I have already heard the one about find a salesman.

My prob is that I must first sell that person on the idea.
If I COULD sell them, I wouldn't need them.

Catch 22

Hope to hear from someone soon.

Thanx

Prolific inventor,
Lousy Salesman,
Incompetent businessman.
(Typical)

Jake,

What Ten-Tec really means is that they have designed and tested it for
50-52 MHz. The spectral purity of the output is not guaranteed from
52-54 MHz although it will transmit in that range. Before using it
above 52 Mhz one should check that its spectral purity (with a spectrum
analyzer) to insure that it meets part 97 regulations.

Too late, nobody wants it, we now chop it up into 800mm lengths and it's
off to the scrap metal merchant with the other offcut cables.

I am looking for do-it-self AL screen sash, but for a
Jalousie Window/s. I figure HAMs that build look at
any AL stock they see, so I posted here. I cannot
find same in the Chicago area, I figure in the warmer
parts more Jalousies, hence screen parts. THANKS

I'm looking for a Manual/schematic for a GE exec receiver model 4ER48A10. This is a high band solid state receiver that I want to convert to the low split of 130 to 150 Mhz. If you have any info I would appreciate a email.

3072. 900 MHz power question.

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-17 00:00:00 UTC
From: Les <lcarlson@northernnet.comX>
Message-ID: <01bc326d$f99ef6e0$ac1e92d0@lcarlson.northernnet.com>
Source record: 95950

Any ideas on where one might look or ask to get information to
increase
the distance a 900 MHz cordless home telephone could operate
between the handset and the base.
I live in a rural setting and work in several different out
buildings. None of which are over 100 feet apart. A brand new
fully charged battery in
my 900 MHz phone will barely allow operation between hand set
and base. After the new battery has been used a couple of
weeks, and even if it is
fully charged, operation of the phone breaks up. I normally let
the battery
near fully discharge before fully recharging.
What I'm wondering is if it is possible to connect an
additional 1 1/2
volt rechargeable battery in series? Will this (without ruining
any
circuitry) allow the phone to have a greater more reliable
range?

Thanks,
Les

Your page on NICAD batteries is very good in fact great. I would suggest a paragraph reviewing the different chips now available to build a reconditioner/charger. I have tried "zapping" batteries also but find that once they have an internal short, clearing the short means that that battery will then have an internal resistive path that shortens the time that the battery will hold the self-charge. This may not be very clear. I hope you can figure out what I tried to say.

3075. Cryptic coil description

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-17 00:00:00 UTC
From: ajass@tabaqui.informatik.rwth-aachen.de
Message-ID: <5gjfjv$550$1@news.rwth-aachen.de>
Source record: 96035

Hallo,

in one of the ARRL-Microwave handbooks, there are coil description
which are absolut cryptic to me.

What means: 4t, 28 swg e.c.w. ?
or 2.5t, 28 swg t.c.w. ?

I guess the t stands for the number of turns. But what is the rest?
Any hints are appreciated.

With best regards
Andreas

I'm trying to figure out if you two are really trying to figure out the
"K-factor", aka the effective earth's radius factor, or the "V", aka the
velocity factor.

A typical K factor varies from a range of 1.25 to 1.45 in the winter
months, to a range of 1.25 to 1.9 during the summer months.

A typical Velocity factor can vary from 0.66 (for some polyethylene
coaxial cables) to 0.95 (for 300-ohm, 1/2-inch parallel line, with air
dielectric).

What'cha lookin' for? :-)

Eric, once the kit is built and aligned, it produces 10W output, any mode, depending on which mode you feed it! It's a bit rough if you feed it more than 5 or 6 watts, especially SSB. I have one, I built it myself. I am in the stages of tuning it up, but it does hear and speak. It's just that it needs to hear better and speak louder. (grin)

28 swg is the wire size... "swg" seems a bit ambiguous. AWG would
be the standard American wire gauge, about 0.0126 inches = 0.32mm
diameter. But swg could be the British standard wire gauge, just
slightly larger for number 28.

e.c.w. would be enamelled copper wire (polyurethane, etc.)
t.c.w. would be tinned copper wire, uninsulated
(b.c.w. would presumably be bare copper wire.)

I don't think much of publications that use abbreviations without
providing a definition or at least a pointer to definitions.

It might help if we knew the value of the inductor.

Best guess: 4t... 4turns, 28 standard wire gauge
evenly spaced, wound clockwise.

2.5T.. 2.5 turns 28 standard wire gauge,
tightly wound clockwise.....

No flames pse. Trying to help fellow HAM.

Please can somebody from the USA answer a question that has been puzzling me for some time.

The conventional soft-start circuit for a large power supply uses a current-limiting resistor in series with the mains supply, and after a few seconds this resistor is shorted by a relay contact.

Why do US publications almost always show two resistors, one in each supply line?

How about a uA723 chip and several power transistors in parallel.
2N3055s are nice and cheap. Don't put your expensive radio on it until
you have added over-voltage protection, and checked that it works.

Yes. It's been around for about 25 years. It was designed for tv antennas and intended to be used instead of coax where a balanced feedline was desired. It's impedance is 300 ohms. Loss is greater than cheap twin lead but less than coax especially if you add in the losses from baluns which are necessary at each end of coax. It can be run over power lines, next to metal gutters or even on the ground. It is not satisfactory for transmitting purposes.

HI
Is there any anybody else out there having had problems with the 723
when RF is present. Remember building a small 4 amp supply using the
metal can version of 723 and a 3055. The p.s. did reduce the output
voltage when I held my H.T above the circuit. At least I'm happy the
voltage went down-wards.....
We have several lab p.s. here using 723 and they all have problems
with RF.

Anyone have a solution for this ? (Using different chip is cheating).

3091. Home made crystal(?) radio

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-18 00:00:00 UTC
From: Claudio Fornaro <fornaro@athena.polito.it>
Message-ID: <332E58B6.41C6@athena.polito.it>
Source record: 95954

Hi all,
I'd want to build a "home made" radio receiver for AM (or even SW...) by putting
together pieces that can be found at home, that is you have not to buy them in an
electronic shop.
To explain better: I intend to build capacitors (maybe with alluminium sheets and
plastic bags), inductors (copper wire), the crystal is a problem... one usually
has no galena crystal at home... the loudspeaker maybe is a bigger one...
Has anyone ever seen such a project made or has s/he any idea about building it?
Thanks in advance.
Claudio

'In Practice' columnist for RadCom (RSGB)

Perhaps it is because the old USA wiring allowed either side to be live (Hot) or neutral. The ARRL step start design uses a diode from HOT to charge a capacitor via a resistor. The capacitor is connected to chassis ground. The relay coil connects across the capacitor. Why they connect to ground and not neutral is not clear, I would have thought it was a sure recipie for tripping the Earth leakage circuit breakers. Why not just connect between live and neutral?

This whole circuit is on the soft side of the step start so, if there is a big voltage drop across the hot resistor, say a fault in the EHT, the relay won't come over - the fuse wont blow either - highly dangerous. OK, so the bang is not so big, but it lasts a lot longer.

I think what is supposed to happen is the initial surge is taken care of by the time constant of the primary resistors and filter caps, this brings the PSU up to nearly full EHT, then we wait for the relay capacitor to charge up before full mains is applied to the transformer.

What would happen if there was only 1 resistor and the mains was the wrong way round? The surge relay would see the voltage drop across the neutral resistor, and possibly operate. This would of course remove the supply to said relay, causing it to cut out again, restoring its supply, one big oscillator. The second resistor prevents this happening. The supply simply won't work properly as the EHT will collapse when asked to supply power.

Because in the USA we are required to limit the electrons flowing back
into the power line, as well as those flowing out, to the same speed.

The reason is we do not want to unbalance the power grid of the USA,
and cause another regional blackout.

Your idea is much safer! In one Handbook article for 3-500's they
connect the filament transformer primary directly to the chassis!!!
To cover up that mistake, they tell the builder to insulate the
chassis from the cabinet! Can you imagine building a high power PA
with the chassis insulated from the cabinet? How do we get those
SO-239's out without a chassis connection?

While the resistors smoke!!!

A better way to do it is to connect the surge relay across the
transformer primary, use only one resistor, and short it when the
PRIMARY reaches near full voltage. Of course the resistor should be
fused with a slow blow fuse in case the supply is shorted (or the
relay fails) at start up.

Not the best circuit they describe, is it?

NO power line return should ever be connected to the chassis in any way, even for a relay and ESPECIALLY for a transformer!!! Fried ham is best in a pan, not a ham shack.

Hi friends,
I've recently bought an old UHF noise source from HP,
model 349A. Unfornately I didn't found the power supply, nor the manual.
Inside the box thereis a glass tube, probably a gas discharge tube
with hot cathode. I'd like very much to know something about how to
build the power supply, and eventually in which frequency range
the "object" should work.
Does someone has some informations ?
Thanks a lot.

So far, Part 15 unlicensed devices are not allowed in the ham bands.
Any intentional unlicensed transmission in our bands, regardless of
power, is illegal. (the FCC had considered lifting that ban, but I
think that threat has been staved off)

>> Hmmmm... then what would you say about 2m <-> 10m FM links?
>> You know, a 2m box coupled to a 10m box. A Tech can then cause

This used to be illegal. Seems to me it was 5-6 years ago they made a
change with the specific intent of allowing this situation.

Ian, It is possible to get surges from either
line to a Common point, such as ground. It is much
safer to protect High-to-Common, High-to-Neutral, and
Neutral-to-common; than just High-to Neutral and High to
Common.

IF you are a tech no code, THIS IS STILL ILLEGAL. Only those with
suitable license class can use such an HV/VHF cross-band repeater.

Bill (and other recent posts) are not correct on this issue.
Part 15.247 and 15.249 (the numbers may not be exact) allow
unlicensed use of spread spectrum and certain non-spread devices
in the Amateur bands at 900MHz, 2.4GHz and 5.7GHz. These are
usually Wireless LANS, newer cordless phones and other consumer
and commercial items. You can also make your own devices for
these bands without license and operate them under Part 15 rules.

I think some individuals may be looking at old copies of the
Part 15 section.

AmSoft announces the 1997 release of "The World of Ham Radio
CD-ROM.
The World of Ham Radio contains the World's largest collection
of amateur radio software, and the most recent FCC amateur radio
license database available anywhere. Track all US and Foreign
Licensees authorized to operate by the FCC. More than 1,000,00
callsigns are found in seconds with this CD-ROM. The current
database includes calls issued up to 14 January 1997. Find hams
by full or partial call sign, prior call sign, last name, first
name, State, City or zip codes. Create your mailing lists or just
print single labels from this FCC Callsign database program.
DOS, Windows 3.x, and *Windows 95 compatible lookups on this
CD-ROM.
Every issue comes with the AmCall auto-logging station logbook
which uses this callsign database. Compatible with most other
amateur radio software packages available today. Also includes
all the "Vanity Flood Gate assignments, plus the missing 3,500
"Vanity Assignment still Available" calls.

There are over 2150 amateur radio modification files included on
this CD-ROM logically arranged by manufacturer, and model number.
That's over 800 new mods since our last issue.

This CD-ROM is non invasive to your drives, this means no hard
drive usage unless you decide to use it.

A Complete user interface "CDVIEW" for the Ham Radio Software
library eliminates the need for you to use DOS commands and
hard drive space. CDVIEW includes Instant online help and
program documentation by pressing the (I) key on your keyboard.
CDVIEW will make it very easy for you to move through and
operate
the massive 20,000+ file compilation. These files could easily fill
822+ Megabytes of space if they were not on this convenient

CD-ROM.
Users can preview new ham software directly on the CD-ROM
without
requiring a hard drive, many of the software programs run directly
from the CD-ROM. You can use the CD-ROM to place files onto
removable diskettes, or to install files onto your computer.

For more information visit: http://hamster.ivey.uwo.ca/~amsoft/
or contact AmSoft direct from the information at the top of this
notice.

I'm here looking at the schematic for my monster 8877 amp. I also have two
resitors. It appears to be the easiest way to have inrush protection with
a dual primary transformer meant for 110v and 220v. So you guys in europe
don't have to worry about this. My amp automatically switches the input
voltage depending on what line connector is attached. I use one of those
monster industrial twist lock with 4 lines and one ground.

Also, I see that for 110v, the resistors are in parallel, while for 220v
they are in series, so that makes some intuitive sense.

I have a QuickCam, so if you want, I can attach picture of schematics as JPEG.

Rob.

ps. linear is in storage, wish it was here, but last time it was in use,
smoked neighbors TV and cost me $100

I can't cite the specific reg (I will if I remember to reread this thread on my other machine in front of my copy of the rules) but I'm 99% sure it *is* legal for a no-code tech to be repeated on 10 meters. The only requirement is that the repeater input (the frequency on which you transmit) is a legal frequency under your license.

At the time the change was passed, there was no such thing as a no-code license. (actually even now, Tech Pluses don't have privileges in the 10m FM band) There was also an issue over the first Oscar satellites, which also retransmitted 2m signals into the 10m band.

Again, I'd double check a copy of the FCC regs before risking your license, but I'm 99% sure it's legal for Tech to be repeated on 10 meters.

Absolutely untrue. Section 97.205 allows for crossband repeater
operation. There are two tests that must be met. the input frequency
of the repeater the tech is operating on must be within his license
priveleges (i.e. 2 meters) and the control operator of the second
repeater (in Samuel's example 10 meters) must hold an appropriate
license.

In Samuel's example, the tech licensee may operate a 2 to 10 meter
crossband repeater, the only other condition to be met is that the
control operator on the 10 meter repeater must hold at least a general
class license. See the General Class license Manual (ARRl) page 1-6

I don't have a solution for the 723 but we experienced the same symptoms
on 15 volt power supplies which we install in radio transmitters. Every
time the step start relays close on the transmitter, the "regulated" 15
volts bounces about 3 volts (and kills the overvoltage protection
circuit.) We talked to Motorola and other suppliers with no success.
Guess that chip and any rf or transient don't mix.

Well, that's how it seemed to me too. I can see the point in surge-limiting each line if the transformer has a center-tapped primary which is connected to neutral, but it seems pointless to use "two of everything" when the transformer has only a 0-230V primary and neutral isn't involved.

Hi everyone!
Could anyone point out sources and/or ideas for typical "HF VOX"
circuits used in VHF [pre]amps (i.e. switch out preamp when HF comes
its way, switch in PA, without using a separate transmit signal from
the rig)? I can't find anything on this topic in my books.
Thanks in advance,
/hcb

I acquired lots of MJ11016 power darlingtons when they were thrown away at work. They are good for about 30 A max. each, and the beta (1000) should be OK with 10 A going through them. I keep meaning to use these in a PS.

You will be not be able to drive 2N3055 devices directly from a 723.
Better to use 2N3771 pass regulators -- much better beta. You still
will need an additional pass stage between the 723 and 3771s.

3117. Poky Toky!! Help please?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-19 00:00:00 UTC
From: Steve Simpson <Steve@chubs.demon.co.uk>
Message-ID: <VSpeNFA2vHMzEwGe@chubs.demon.co.uk>
Source record: 95902
Cross-posted to: rec.radio.amateur.homebrew,uk.radio.amateur

Hi all,
I have two little handhelds called Poky Toky's they operate on 144.550 mhz FM. They have an output of about 10mW I think.

The problem I have is 144.55 is used by packet around here and I'd really like to re-rock them for another frequency.
This is where the fun starts. The RX IF is 10.7 followed by .455 and a 10.240 rock is used to do this, nothing strange here. But the RX rock in the first LO has 19.122 mhz on it??? Now I can't make that go in to 144.55 anyway I try. Also the TX rock is in the 20 meg area (I can't remember exactly at the moment) This also doesn't seem to divide into 144.55.

Has anyone come across Poky Toky's before or perhaps they can do better maths than me and work out the Xtal equation for me? I'm at my wits end over this one.

Thanks all,

For sale or trade:

Lettine Radio model 242 six-meter a-m transmitter, 1950s vintage.
Crystal controlled, 6146 PA, plate-modulated by pair of 6V6s.

*** THIS IS A PROJECT RADIO, OTHERWISE KNOWN AS A "FIXER-UPPER" ***

It appears to be complete, although there are no tubes (they tested
bad, so I threw 'em away). The front panel and cabinet are ROUGH
but restorable. The panel will need to be stripped, painted, and
re-lettered. The cabinet will also need to be stripped and painted.
Inside, it's not real bad. The chassis should clean up nicely, and
underneath is surprisingly clean and free of mud-dauber tubes, etc.
Obviously, all of the old rolled paper and electrolytic capacitors
will need to be replaced, and I suspect some resistors will also,
but that's standard procedure when restoring any old rig like this.

This transmitter was found in a barn by a non-ham. It was offered
first to other local hams, who all turned it down. I accepted it
only to keep it from going to the landfill. I figured someone out
there would be willing to restore it and give it a good home.

I honestly have no idea what something like this is worth, so make
me an offer, and please don't be afraid to insult me. I assure you
that I am not "trolling for suckers" to see if I can snag big bucks
on this, 'cuz there ain't no way it would EVER bring big bucks!

I'd be willing to trade it for a fixer-upper novice rig (Heath, Eico,
Drake, Knight, etc), or parts for building "glowbugs" (especially
air variables, B & W 3011 and 3015 coil stock, small milliammeters,
plug-in coil forms and sockets, etc). Whatcha got that I could use?

BTW, the manual is available from W7FG Vintage Manuals for under $10.

Our club, the KCRC, raffled a 2 meter AM transceiver away. It was one
of those classic Gonset Communicatiors. The only problem is who
are you going to communicate with. Operating 6 meter AM even with a
clean signal is going to take full control of channel 2 on all nearby
TVs.
One of our young novices won the set so I warned him NOT to play with
the innards of it when alone because of the high voltages that could
even still be there long after it is unplugged. He was amazed. (better
amazed than dead) You of course would not be surprised that most hams
know very little about hight voltage curcuits. I hope to make a club
project out of restoring the rig. Perhaps you can do that with your
radio in case someone finds a "real treasure". Knowing how to replace
the non-tube items such as the capacitors is an art in itself.

....**

Dr. Spinella:

I presume the box you have is slightly smaller than fist-sized? If so,
the tube is the "classic" vacuum diode noise source. It was intended to
be used with the old (number I don't remember even though I have one at
home) vacuum tube noise figure meter. Its range is nominally HF to
about 400 MHz and produces (nominally) 5.2 dB of excess noise when
biased in the normal fashion with about 120 to 150 volts on the plate.
The output, of course, is the BNC connector which is ac coupled to the
plate. The thing presents a relatively stable 50+/- j0 ohm source
impedance over the useful frequency range. You should note that the ENR
(excess noise ratio) is stable for only about the first 50 hours of
operation until some of the cathode material deposites itself onto the
plate and begins to produce "non-standard" diode noise characteristics.
The plate voltage and/or the cathode bias was typically switched on and
off (chopped) at a 400 to 1000 Hz rate to give a "noise on/noise off"
signal to the receiver or front end under test. The rest of the noise

figure meter from HP simply compared these two measured values, did the arithmatic and took the difference, and read out (analog) the noise figure. You can make a nice gated (or continuous) noise source out of it, but the solid state noise diodes (from NoiseCom, for example) are a more stable and wider frequency range solution to a good noise source. A typical solid state noise diode (the cheap variety) is good from nearly audio to 2 - 3 GHz and all voltages are < 15 vdc (or chopped) with no impedance stabilization network needed if its mounted in an intelligent microwave manner. Hope this helps.

Claudio:

Also being a mineral collector, I never had trouble with a galena
crystal. However, you need it. I would suggest you contact on of your
rock and mineral clubs, or possibly the geology depqrtment of your
nearby university. You don't need a big, showy piece. Probably
they would be glad to give you a few small chunks. It is not
a rare mineral. If you could also locate a nearby rock and mineral
store or dealer, they would probably do the same for you. However, if
you reall want to completely "roll your own", contact the geology
department as before, but ask them where you might collect some galena
yourself. Its fun, and you just might gain another hobby! By the way,
iron pyrite, oxided iron filings, powdered ZnS (zinc sulfide, or the
mineral sphalerite - many times associated with pyrite and galena) also
work to a lesser extent. Good Luck!

Doug:

Yes, I used it ages ago not totally understanding what it was supposed to do. It is basically shielded 300-ohm balanced transmission line. If everything from the antenna to the receiver were truely balanced at all frequencies, there would be no need for the shield. The shield is supposed to keep common mode "noise" (like HF amateur transmitters) out of the transmission line, and, therefore, the TV receiver. A fully balanced transmission has no need for a shield. If the shield is properly terminated at both ends, its marginally successful. The shield is too thin to effectively shield magnetics fields generated much below 20 MHz. Where do you "terminate" the shield at the TV antenna end? Who knows! In reality, just use "normal" twin lead and forget the additional expense and bulk of the shielded stuff.

Message-ID: <5gq7fi$7fb@mtinsc03.worldnet.att.net>
Source record: 95911

I have built several PwrSups using the 723 all work great with no RF problems, 1.8 - 28 MHz w/KW amp following exciter. Also used w/ no problem up to 440 MHz running 100wt. out and 900 @ 18 wts. Good construction practice is reccommended. If the regulator is so "slow" that bypassing is unneccessary, it's transient response will llikely be poor. My biggest supply I rate at 80 amps continuous. There are 4 2N5302 (30 amp, 200 wt) transistors driven darlington mode by a 5th 5302 and a 723. The 4 parallel devices are balanced with high current low value emitter resistors. They are mounted to a large forced air cooled heat sink (fan on thermal switch). This supply is about 20 years old and still going strong. A "crowbar" over-voltage/ fast, high current fuse is in the output. Short circuit protection is sorta like a solid state overcurrent latch connected to the 723. If you short the 13.6 v, 80 amp supply it just turns off the output (not even a good spark, no fuse blown). Push a button to reset.....

If I were to do it again, I would consider stacking three high current (surplus) 5 volt (floating) switcher supplies. If so, attention must be paid to RFI shielding. ...The linear generates no RF noise.

I do hope you meant to say connect a N.O. relay in SERIES with the
transformer primary, across the current limiting resistor. Relay to
short the resistor when the surge subsides....

3128. Trap/Balun losses

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-03-19 00:00:00 UTC
From: "Roger A. McCarty" <rmccarty@deltanet.com>
Message-ID: <3330B264.4D7D@deltanet.com>
Source record: 95913
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

Perhaps someone would like to comment on this. I have read what seems to be, two conflicting reports regarding trap and/or balun losses. To wit;

From the ARRL Antenna Handbook, 1994. Page 11-28, paragraph 3;

"If 1500 watts of transmitter power is going into an antenna, a loss of 0.5db amounts to 163 watts. This would create a significant amount of heat in the six traps that are on average in a TH6DXX, amounting to 27 watts per trap. If the loss were as high as 1db, this would be 300 watts total, or 50 watts per trap. Common sense says that if overall loss were greater than 0.5 db, the traps would act more like big firecrackers than resonant circuits!"

Note the power loss reference dissipated in the traps.
now this,

from QST March 1977, page 76 paragraph 8;

(refering to the Tucker T-3000 antenna tuner) "The situation got much worse in the balanced mode, where power losses ranged from 35% to an astonishing 99% across 160 meters and 60% or higher on 80 meters for low impedance loads."

This leads me to place a LARGE question mark behind everything alleged as factual in this article. It doesn't matter what power level you may consider, for example 100 watts. According to the writer, 99 watts will be dissipated by the balun. 99 WATTS!! at 1KW, 990 watts will be dissipated by the balun! Come on!

I own a Tucker/Vectronics Tuner and I use a balanced line fed antenna system everyday on 75 meters. From practical experience I can tell you this is pure nonsense. Similar or other perspectives are invited.

>voltage went down-wards.....

Just speculating, but since the output voltage always dropped when the RF was present, it might enter the circuit from the current limiting (short circuit protection) circuit. In a typical 723 circuit, the output current flows through a small current sensing resistor (typically much less than 1 ohm in a big PSU) and then to output terminal of the PSU (with long external leads attached). An internal NPN is connected across the current sensing resistor, emitter ("Current sense" terminal of the 723) to the lower end of the resistor (PSU output terminal) and the base ("Current limit" terminal of the 723) to the upper end (the series pass transistor end). When the voltage drop exceed 0.7 V, the internal transistor conducts, robbing some current from the internal differential amplifier, reducing the output voltage.

If in some way a large _differential_ RF voltage is developed across the Current limit and Current sense terminals, the internal transistor acts as an rectifier, the negative half-cycle is cut off and the positive half-cycle increase the current through the current sense transistor shunting the differential amplifier and reducing output voltage.

If the current sense resistor is near the series pass transistor (at the heat sink) and far away from the 723 regulator board, the interconnection leads (and the self inductance of the wire wound high power current sense resistor) form a quite effective antenna, since it is a considerable part of a quarter wavelength at 2 m.

The eliminate this source of RFI, use a twisted pair for Current Sense and Current Limit wires, since this will greatly reduce the _differential_ voltage picked up by the lines. You could even use ferrites at the 723 end of the 723 to even further reduce the differential voltage without affecting the DC-conditions. This is a safe place to insert ferrites, since this part of the circuit is not in the feedback loop during normal operation (non-short circuit condition).

However, be very careful about inserting ferrites or RF-bypass capacitors into the voltage sense feedback loop, since this can compromise the stability of the loop even during normal operation.

As I said, this is just speculating, but hopefully it will help someone to troubleshoot their problems, at least by eliminating one source.

I'm pretty confident that it is possible to construct a p.s. using the
723 in a RF-application. Anyone remember the PS7 for the Drake TR7?
They used the 723 and apparently it does work!

Somehow I would feel more secure using a circuit that is behaving
properly without any special decoupling etc.

Some years ago I did bulid a 25 Amp supply using a descrete design
from the OZ ham magazine. Worked like a charm and was scalable up to
more than 50 amps.

My conclution is: stay away from the 723 and you be out of trouble!

BTW. Use more modern transistors than the 2N3055 as they tends to
loose beta when delivering high current!

With ten ohm resistors, maximum inrush power would be the same on 240
v and 120 v, so that makes sense. But the circuits Ian was looking at
have a 240 volt only primary.

I think the inrush stuff is minor compared to safety issues.

>BTW. Use more modern transistors than the 2N3055 as they tends to
>loose beta when delivering high current!

The 2N3055 is quite usable for up to 4 A per transistor. For a 40 A power supply, you would need 10 of these in parallel, but you have to be prepared to feed 2 A of base current into this circuit. (However, using only four 2N3055s to deliver 40 A, would require 8 A of base current, since the current gain drops to 5).

The worst problem with 2N3055 is that the Vbe and Vce(sat) voltages increase quite rapidly above 4 A collector current, forcing the use of a higher transformer secondary voltage, which in turn increase the power dissipation in the series pass transistors.

I need to make a 15 volt PSU supplying around 10 amps continues. Does anyone have any cheap off the shelf ideas. Perhaps using one of the LM series of regulators and 3055's. Even a simple zener diode type affair will probably do.

I've never really got involved with PSU's before but I feel I need to move on from batteries!! :->

Can anyone help or perhaps point me in the direction of a suitable circuit please?

Hey Paul, thanks for the schematics. Found that I had to go into the PTO box after all, couldn't get to everything from the outside.

Built the frequency lock from QEX February 1996, and incorporated it using the FSK diode. It locks within a few seconds, and will hold one of those beauties within a Hz or 2 for DAYS!

(Doesn't do a thing for the backlash in an old one however, the DDS is a big improvement in that respect.)

Thanks again

Gudday,

Rough guess with 3mw diode is some efficiency factor and I peg it to 1mw or the equivalent of 0 dbm on the sig gen.
From there the RELATIVE db range can be seen by substituting the sig. gen. output range versus the diode shining dead into the detector.. I measure about 124 dbm range and it looks the equivalent of about 3 uv. sensitivity to me.

My best front end to date is the VTP diode reverse biased with a 82k resistor back to filtered 9 vdc.. coupled with a .1 to the gate of a mpf-102 which sees a 1 meg to gnd. A 1.2k resistor in the drain lead, bypased and the source resistance of 500 ohm coupled via a .1 into the DBMixer with a L.O. of 4 mhz. gives me s-1 noise floor on the TS930 receiver at 4++ mhz. with the VLF converter running..

The main advantage of subcarrier I see is greatly diminished base band sounds from noisey lights, car headlights, rain drops, ambient, etc.. At 40 khz things get pretty quiet and i track a 124 dbm difference there between the full ON signal from the laser diode into the pin detector at dark/noisey signal and this sounds more like a communications receiver sensitivity/dynamic range all the time..

I am using the transverter IN/OUT from the hf rig to limit the power during transmit which can run duplex using different tx/rx and different sub frequencies or simplex using the same subcarrier/rig..

This system allows me to tune to baseband for basic cw/am phone set ups and almost any subcarrier freq. for ANY type of modulation ssb/fm/data etc..

The carrier as seen in a 800hz beat into the CCW/BPSK tuning utility ala VE2IQ shows a very stable carrier with resolution to well within 1 hz., enough for easy CCW and the accompanied S/N improvement but as it stands now is only needed on a very noisey circuit..

I hope this running commentary is helpful, it sure lets me see my own thoughts more clearly.. Lets hear from you..

From there the RELATIVE db range can be seen by substituting the sig. gen. output range versus the diode shining dead into the detector.. I measure about 124 dbm range and it looks the equivalent of about 3 uv. sensitivity to me.

My best front end to date is the VTP diode reverse biased with a 82k resistor back to filtered 9 vdc.. coupled with a .1 to the gate of a mpf-102 which sees a 1 meg to gnd. A 1.2k resistor in the drain lead, bypased and the source resistance of 500 ohm coupled via a .1 into the DBMixer with a L.O. of 4 mhz. gives me s-1 noise floor on the TS930 receiver at 4++ mhz. with the VLF converter running..

The main advantage of subcarrier I see is greatly diminished base band sounds from noisey lights, car headlights, rain drops, ambient, etc.. At 40 khz things get pretty quiet and i track a 124 dbm difference there between the full ON signal from the laser diode into the pin detector at dark/noisey signal and this sounds more like a communications receiver sensitivity/dynamic range all the time..

I am using the transverter IN/OUT from the hf rig to limit the power during transmit which can run duplex using different tx/rx and different sub frequencies or simplex using the same subcarrier/rig..

This system allows me to tune to baseband for basic cw/am phone set ups and almost any subcarrier freq. for ANY type of modulation ssb/fm/data etc..

The carrier as seen in a 800hz beat into the CCW/BPSK tuning utility ala VE2IQ shows a very stable carrier with resolution to well within 1 hz., enough for easy CCW and the accompanied S/N improvement but as it stands now is only needed on a very noisey circuit..

I hope this running commentary is helpful, it sure lets me see my own thoughts more clearly.. Lets hear from you..

>will probably do.

There is a 10 amp 3-terminal regulator about, but AFAICR it's rather
pricey.

I'd be tempted to go the LM317T plus 2N3055s route. I'll see if I can
find any circuits.

>I've never really got involved with PSU's before but I feel I need to
>move on from batteries!!

I'd stick with the battery and float a good, accurately-regulated 13.8v
supply across it (with dropout contactor or other anti-backflow device
if need be). All my gear is fed in this way. It gives you a good UPS,
and more importantly provides protection against a shorted regulator
putting 25v or more on your gear. IMHO much better than a crowbar, which
I've found can be subject to false triggering by spikes and local RF
fields.

>the rig)? I can't find anything on this topic in my books.
>Thanks in advance,

Hello Hans-Christian,

The circuit is really simple. sample some RF from the antenna
line with a 1 pF capacitor, rectify it with two diodes, connected
in a voltage doubling arrangement and feed this to the base of a transistor
which has else no base bias. than maybe a second transistor, and you have
enough current for the relays.

Good luck, Moritz DL5UH

From: jupiter@europa.com
Message-ID: <jupiter-ya023580002003971823450001@news.europa.com>
Source record: 95857

Already, I've gotten complaints from whiners regarding my linear picts.

Well, if political debates regarding "Little LEO's", whatever that means, can occupy the NG, then you should be complaining to them, not me.

Also, I am very intereested in seeing others' homebrew projects captured via QuickCams, etc.

If QST can begin with 20pp of pictures then we can assuredly do the same with this NG. Also, I can put schematics onto JPEGS.

This is brand new territory with this NG, and I am already getting rave reviews from some of the less timid QST authors.

Anyway, thanks for your time, Rob

[SNIP]

I hope your lapdog Tony is reading this group too Rich, cuz here is another example where you are dead wrong (no pun intended).

>>
>Whether one or two step-start resistors is used with a 240v amplifier, the
>chassis is always connected to the mains-neutral. What safety issues?

The safety issue is the one you just introduced.

THE NEUTRAL IS TIED TO EARTH AT THE SERVICE ENTRANCE..... After that, it is treated as a current carrying conductor. The safety ground (what you should be tying to the chassis) carries fault current only, as John, WA0VYZ, clearly points out in his post.

This NG is supposed to be about construction, not speculation or humiliation. The amazing thing about my amp was the construction and acquisition of parts, not the schematic or size of the tube. Put up or shut up. Thats why I posted all the JPEGs. It sounds like you are one of those speculators and not a doer. But its not my fault. The local ham store here, they would always say: we just can't get any of those exotic parts. Now they are Chapter 11. Meanwhile, my construction projects go on.

I guess you aren't interested in getting any of those free 5.2mhz 2.5khz and 25Ohz linear phase filters that I posted. Others can inquire.

Rob.

The activation or "capcode is a 7 digit number also printed on the back
of the pager itself. A few companies provide demo software for computer
paging and can be found on the web.

I'm looking for a good xmitter design to use for packet radio data.
The range needed is about 100 meters. Small size and current use are
the primary requirements.

Any ideas?

Chris Coupland
ccoupland@pei.sympatico.ca

Probably,

e.c.w. = enamelled copper wire
t.c.w = tinned copper wire

Did the book say swg (standard [British] wire gauge) or awg (American gauge)?

From: johnsonhe@aol.com
Message-ID: <19970320134201.IAA28553@ladder01.news.aol.com>
Source record: 95920

Well, if you take the output frequency 144.55 and subtract the first IF of 10.7, you get 133.85 MHz which is 7 times the xtal frequency of 19.122. So if you'd like to spend the money on rocks, I'd suggest buying some that are -10.7 and divided by 7 to get the frequency you need.

W4ZCB

And they say these differential equations are tough!

Is it possible to just use enamelled copper wire for all coils (provided the insulation is scraped away if a tap has to be made)? Or is there some good reason for using bare/tinned copper wire (RF signal handling etc.)? TIA

>Thanks in advance,
>/hcb
>
A simple RF VOX consists of a simple voltage doubler circuit (small input capacitor, two diodes and a small smoothing capacitor) followed by a comparator, some circuit to control the attack and decay times (a long decay time is required for SSB) and the relay driver.

The RF-VOX works great for FM and usually also for CW, since the input signal is well defined.

However, if you plan to operate SSB and your PTT on your microphone does not produce a loud key click when keyed, there is a risk that the rig is in transmit mode and will pick up some ambient noise from the room before you say the first word, which will eventually key the RF-VOX. Prior to this, the RF-signal from the ambient noise in the room might be sufficient to damage the external preamplifier before the RF VOX switches to transmit mode. Thus, the RF VOX must be quite sensitive.

For SSB operation, I would recommend controlling the [pre]amplifier directly with the PTT (and not the RF VOX), since this will reduce the risk for preamplifier damage. In addition, no prolonged decay is required and the whole system goes to receive as soon as the PTT is released. An annoying feature with RF-VOX SSB operation is the long decay time required, during which time you will loose the first words of the response from the other operator :-).

> P.S. Please reply by mail also, since I can't spend all day reading
> news without pissing off my boss!

Nice anti spam system you have invented :-), however, when you requested e-mail response, I think you should have said to use the address in your sig. Fortunately I noticed your address before hitting the send key :-).

Source record: 95925

UHF Power Amplifier Modules

The MITSUBISHI M67729H2 has been developed and produced in large quantities
for UHF cellular telephone applications.

Technical Data:
Output Power = 20 W
Gain = 21 dB
Harmonics = -40 db
Spurious Outputs = -70 dB
50 Ohm in/out

This module is also excellent suited for class C Amateur Radio PA's in the 70 cm-Band.
The low output of a UHF handheld may be amplified to about 20 W output! The use of these
modules is the easiest way to build a PA. There are various discriptions in the ham
literature.

I am now able to offer you this excellent module with a more than 10 dB! price
reduction:

1 ea for DM 35,--
10 ea for DM 300,--

plus postage with C.O.D. charge.

Klaus-J. Sauvant Tel.: (+49) 2405-85123
